# A Triple Inequality with Series and Improper Integrals 

Florentin Smarandache<br>Department of Mathematics<br>University of New Mexico<br>Gallup, NM 87301, USA

#### Abstract

.

As a consequence of the Integral Test we find a triple inequality which bounds up and down both a series with respect to its corresponding improper integral, and reciprocally an improper integral with respect to its corresponding series.

2000 MSC: 26D15, 40-xx, 65Dxx

## 1. Introduction.

Before going in details to this triple inequality, we recall the well-known Integral Test that applies to positive term series:
For all $x \geq 1$ let $f(x)$ be a positive continuous and decreasing function such that $f(n)=a_{n}$ for $\mathrm{n} \geq 1$. Then:

$$
\begin{equation*}
\sum_{n=1}^{\infty} a_{n} \text { and } \int_{1}^{\infty} f(x) d x \tag{1}
\end{equation*}
$$

either both converge or both diverge.
Following the proof of the Integral Test one easily deduces our inequality.

## 2. Triple Inequality with Series and Improper Integrals.

Let's first make the below notations:

$$
\begin{align*}
& \mathrm{S}=\sum_{n=1}^{\infty} a_{n},  \tag{2}\\
& \mathrm{I}=\int_{1}^{\infty} f(x) d x . \tag{3}
\end{align*}
$$

We have the following
Theorem (Triple Inequality with Series and Improper Integrals):

For all $x \geq 1$ let $f(x)$ be a positive continuous and decreasing function such that $f(n)=a_{n}$ for $\mathrm{n} \geq 1$. Then:

$$
\begin{equation*}
\text { S }-\mathrm{f}(1) \leq \mathrm{I} \leq \mathrm{S} \leq \mathrm{I}+\mathrm{f}(1) \tag{4}
\end{equation*}
$$

Proof.
We consider the closed interval $[1, n]$ the function f is defined on split into $\mathrm{n}-1$ unit subintervals $[1,2],[2,3], \ldots,[n-1, n]$, and afterwards the total area of the rectangles of width 1 and length $f(k)$, for $2 \leq k \leq n$, inscribed into the surface generated by the function f and limited by the x -axis and the vertical lines $\mathrm{x}=1$ and $\mathrm{x}=\mathrm{n}$ :

$$
\begin{equation*}
\mathrm{S}_{\mathrm{inf}}=\sum_{k=2}^{n} f(k)=\mathrm{f}(2)+\mathrm{f}(3)+\ldots+\mathrm{f}(\mathrm{n}) \quad[\text { inferior sum }] \tag{5}
\end{equation*}
$$

and respectively the total area of the rectangles of width 1 and length $f(k)$, for $1 \leq k \leq n-1$, inscribed into the surface generated by the function $f$ and limited by the $x$-axis and the vertical lines $\mathrm{x}=1$ and $\mathrm{x}=\mathrm{n}$ :

$$
\begin{equation*}
\mathrm{S}_{\text {sup }}=\sum_{k=1}^{n-1} f(k)=\mathrm{f}(1)+\mathrm{f}(3)+\ldots+\mathrm{f}(\mathrm{n}-1) \quad \text { [superior sum] } \tag{6}
\end{equation*}
$$

But the value of the improper integral $\int_{1}^{\infty} f(x) d x$ is in between these two summations:

$$
\begin{equation*}
\mathrm{S}_{\mathrm{n}}-\mathrm{f}(1)=\mathrm{S}_{\mathrm{inf}} \leq \int_{1}^{n} f(x) d x \leq \mathrm{S}_{\text {sup }}=\mathrm{S}_{\mathrm{n}-1} \tag{7}
\end{equation*}
$$

where

$$
\begin{equation*}
\mathrm{S}_{\mathrm{n}}=\sum_{k=1}^{n} f(k) . \tag{8}
\end{equation*}
$$

Now in (7) computing the limit when $\mathrm{n} \mapsto \infty$ one gets a double inequality which bounds up and down an improper integral with respect to its corresponding series:

$$
\begin{equation*}
\mathrm{S}-\mathrm{f}(1) \leq \mathrm{I} \leq \mathrm{S} \tag{9}
\end{equation*}
$$

And from this one has

$$
\begin{equation*}
\mathrm{S} \leq \mathrm{I}+\mathrm{f}(1) \tag{10}
\end{equation*}
$$

Therefore, combining (9) and (10) we obtain our triple inequality:

$$
\mathrm{S}-\mathrm{f}(1) \leq \mathrm{I} \leq \mathrm{S} \leq \mathrm{I}+\mathrm{f}(1)
$$

As a consequence of this, one has a double inequality which bounds up and down a series with respect to its corresponding improper integral, similarly to (9):

$$
\begin{equation*}
\mathrm{I} \leq \mathrm{S} \leq \mathrm{I}+\mathrm{f}(1) \tag{11}
\end{equation*}
$$

Another approximation will be:

$$
\begin{equation*}
\mathrm{S}_{\mathrm{n}} \leq \mathrm{S} \leq \mathrm{S}_{\mathrm{n}}+\mathrm{I}_{\mathrm{n}} \tag{12}
\end{equation*}
$$

where

$$
\begin{equation*}
\mathrm{I}_{\mathrm{n}}=\int_{n}^{\infty} f(x) d x \text { for } \mathrm{n} \geq 1 \tag{13}
\end{equation*}
$$

and $I_{1}=I, S_{1}=a_{1}=f(1)$.
The bigger is n the more accurate bounding for S .

These inequalities hold even if both the series S and improper integral I are divergent (their values are infinite). According to the Integral Test if one is infinite the other one is also infinite.

## 3. An Application.

Apply the Triple Inequality to bound up and down the series:

$$
\begin{equation*}
\mathrm{S}=\sum_{k=1}^{\infty} \frac{1}{k^{\wedge} 2+4} \tag{14}
\end{equation*}
$$

The function $\mathrm{f}(\mathrm{x})=\frac{1}{x^{\wedge} 2+4}$ is positive continuous and decreasing for $\mathrm{x} \geq 1$. Its corresponding improper integral is:

$$
\begin{aligned}
\mathrm{I} & =\int_{1}^{\infty} \frac{1}{x^{\wedge} 2+4} d x=\lim _{\mathrm{b} \rightarrow \infty} \int_{1}^{b} \frac{1}{x^{\wedge} 2+4} d x=\lim _{b \rightarrow \infty}\left[\frac{1}{2} \arctan \frac{x}{2}\right]_{1}^{b} \\
& =\frac{1}{2} \lim _{\mathrm{b} \rightarrow \infty}\left(\arctan \frac{b}{2}-\arctan \frac{1}{2}\right)=\frac{1}{2}\left(\frac{\pi}{2}-\arctan 0.5\right) \approx 0.553574 .
\end{aligned}
$$

Hence:

$$
0.553574=\mathrm{I} \leq \mathrm{S} \leq \mathrm{I}+\mathrm{f}(1)=0.553574+1 /\left(1^{\wedge} 2+4\right)=0.753574
$$

or

$$
0.553574 \leq \mathrm{S} \leq 0.753574
$$

With a TI-92 calculator we approximate series (14) summing its first 1,000 terms and we get:

$$
S_{1000}=\sum\left(1 /\left(x^{\wedge} 2+4\right), x, 1,1000\right)=0.659404 .
$$

Sure the more terms we take the better approach for the series we obtain.
In a similar way one can bound up and down an improper integral with respect to its corresponding series.
