# The New Prime theorem (8) 

$x^{6}+1091$ has no prime solutions<br>Chun-Xuan Jiang<br>P. O. Box 3924, Beijing 100854, P. R. China<br>jiangchunxuan@vip.sohu.com

Abstrat
Using Jiang function we prove that $x^{6}+1091$ has no prime solutions.
Shanks conjectured[1,2]:

| $f(x)$ | $f(m)$ is composite for all $m$ up to |
| :--- | ---: |
| $x^{6}+1091$ | 3905 |
| $x^{6}+82991$ | 7979 |
| $x^{12}+4094$ | 170624 |
| $x^{12}+488669$ | 616979 |

The smallest prime value of the last polynomial has no less than 70 digits.

## Theorem 1.

$$
\begin{equation*}
(P+1)^{6}+1091 \tag{1}
\end{equation*}
$$

has no prime solutions
Proof. We have Jiang function[3]

$$
\begin{equation*}
J_{2}(\omega)=\prod_{P}[P-1-\chi(P)], \tag{2}
\end{equation*}
$$

where $\omega=\prod_{P} P$,
$\chi(P)$ is the number of solutions of congruence

$$
\begin{equation*}
(q+1)^{6}+1091 \equiv 0 \quad(\bmod P) \tag{3}
\end{equation*}
$$

$q=1, \cdots, P-1$.
From (3) we have $\chi(2)=0, \chi(3)=2, \chi(5)=2, \chi(7)=6$.
Substituting it into (2) we have

$$
J_{2}(3)=0, \quad J_{2}(7)=0 .
$$

We have prove that (1) has no prime soultions.
In the same way we prove that $x^{6}+82991$ has no prime solutions.

## Theorem 2.

$$
\begin{equation*}
P^{12}+4094 \tag{4}
\end{equation*}
$$

has no prime solutioins
Proof. We have Jiang function [3]

$$
\begin{equation*}
J_{2}(\omega)=\prod_{P}[P-1-\chi(P)], \tag{5}
\end{equation*}
$$

$\chi(P)$ is the number of soultions of congruence

$$
\begin{equation*}
q^{12}+4094 \equiv 0 \quad(\bmod P), \tag{6}
\end{equation*}
$$

$q=1, \cdots, P-1$.
From (6) we have

$$
\begin{equation*}
\chi(5)=4, \quad \chi(13)=12 \tag{7}
\end{equation*}
$$

Substituting it into (5) we have $J_{2}(5)=0, J_{2}(13)=0$. We prove (4) has no prime solutions. In the same way we are able to prove $x^{12}+488669$ has no prime solutions
