# An introduction to the Smarandache Square Complementary function 

Felice Russo<br>Via A. Infante<br>67051 Avezzano (Aq) Italy<br>felice.russo@katamail.com

Abstract<br>In this paper the main properties of Smarandache Square Complementary function has been analyzed. Several problems still unsolved are reported too.

The Smarandache square complementary function is defined as [4],[5]:

$$
\operatorname{Ssc}(\mathrm{n})=\mathrm{m}
$$

where m is the smallest value such that $m \cdot n$ is a perfect square.
Example: for $\mathrm{n}=8, \mathrm{~m}$ is equal 2 because this is the least value such that $m \cdot n$ is a perfect square.

The first 100 values of $\operatorname{Ssc}(\mathrm{n})$ function follows:

| n | Ssc ( n ) | n | Ssc (n) |  | Ssc (n) |  | n | Ssc ( n ) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 26 | 26 | 51 | 51 | 76 | 19 |  |
| 2 | 2 | 27 | 3 | 52 | 13 | 77 | 77 |  |
| 3 | 3 | 28 | 7 | 53 | 53 | 78 | 78 |  |
| 4 | 1 | 29 | 29 | 54 | 6 | 79 | 79 |  |
| 5 | 5 | 30 | 30 | 55 | 55 | 80 | 5 |  |
| 6 | 6 | 31 | 31 | 56 | 14 | 81 | 1 |  |
| 7 | 7 | 32 | 2 | 57 | 57 | 82 | 82 |  |
| 8 | 2 | 33 | 33 | 58 | 58 | 83 | 83 |  |
| 9 | 1 | 34 | 34 | 59 | 59 | 84 | 21 |  |
| 10 | 10 | 35 | 35 | 60 | 15 | 85 | 85 |  |
| 11 | 11 | 36 | 1 | 61 | 61 | 86 | 86 |  |
| 12 | 3 | 37 | 37 | 62 | 62 | 87 | 87 |  |
| 13 | 13 | 38 | 38 | 63 | 7 | 88 | 22 |  |
| 14 | 14 | 39 | 39 | 64 | 1 | 89 | 89 |  |
| 15 | 15 | 40 | 10 | 65 | 65 | 90 | 10 |  |
| 16 | 1 | 41 | 41 | 66 | 66 | 91 | 91 |  |
| 17 | 17 | 42 | 42 | 67 | 67 | 92 | 23 |  |
| 18 | 2 | 43 | 43 | 68 | 17 | 93 | 93 |  |
| 19 | 19 | 44 | 11 | 69 | 69 | 94 | 94 |  |
| 20 | 5 | 45 | 5 | 70 | 70 | 95 | 95 |  |
| 21 | 21 | 46 | 46 | 71 | 71 | 96 | 6 |  |
| 22 | 22 | 47 | 47 | 72 | 2 | 97 | 97 |  |
| 23 | 23 | 48 | 3 | 73 | 73 | 98 | 2 |  |
| 24 | 6 | 49 | 1 | 74 | 74 | 99 | 11 |  |
| 25 | 1 | 50 | 2 | 75 | 3 | 100 | 1 |  |

Let's start to explore some properties of this function.

Theorem 1: $\operatorname{Ssc}\left(n^{2}\right)=1$ where $n=1,2,3,4 \ldots$

In fact if $k=n^{2}$ is a perfect square by definition the smallest integer m such that $m \cdot k$ is a perfect square is $\mathrm{m}=1$.

Theorem 2: $\operatorname{Ssc}(p)=p$ where $p$ is any prime number
In fact in this case the smallest m such that $m \cdot p$ is a perfect square can be only $\mathrm{m}=\mathrm{p}$.

Theorem 3: $\operatorname{Ssc}\left(p^{n}\right)=\left\lvert\, \begin{aligned} & \mid \text { if } n \text { is even } \\ & \mid p \text { if } n \text { is odd }\end{aligned} \quad\right.$ where $p$ is any prime number.

First of all let's analyze the even case. We can write:

$$
p^{n}=p^{2} \cdot p^{2} \cdot \ldots \ldots . . \cdot p^{2}=\left|p^{\frac{n}{2}}\right|^{2} \text { and then the smallest } \mathrm{m} \text { such that } p^{n} \cdot m \text { is a perfect square is } 1 .
$$

Let's suppose now that n is odd. We can write:

$$
p^{n}=p^{2} \cdot p^{2} \cdot \ldots \ldots . . \cdot p^{2} \cdot p=\left|p^{\left\lfloor\frac{n}{2}\right\rfloor}\right|^{2} \cdot p=p^{2\left\lfloor\left\lfloor\frac{n}{2}\right\rfloor\right.} \cdot p
$$

and then the smallest integer $m$ such that $p^{n} \cdot m$ is a perfect square is given by $m=p$.

Theorem 4: $\operatorname{Ssc}\left(p^{a} \cdot q^{b} \cdot s^{c} \cdot \ldots . \ldots . . \cdot t^{x}\right)=p^{\text {odd }(a)} \cdot q^{\text {odd }(b)} \cdot s^{\text {odd }(c)} \cdot \ldots \cdot t^{\text {odd }(x)}$ where $p, q, s, \ldots$, t are distinct primes and the odd function is defined as:

$$
\operatorname{odd}(n)=\begin{array}{ll}
\mid 1 & \text { if } n \text { is odd } \\
\mid 0 & \text { if } n \text { is even }
\end{array}
$$

Direct consequence of theorem 3.

Theorem 5: $\operatorname{The} \operatorname{Ssc}(n)$ function is multiplicative, i.e. if $(n, m)=1$ then $\operatorname{Ssc}(n \cdot m)=\operatorname{Ssc}(n) \cdot \operatorname{Ssc}(m)$

Without loss of generality let's suppose that $n=p^{a} \cdot q^{b}$ and $m=s^{c} \cdot t^{d}$ where $\mathrm{p}, \mathrm{q}, \mathrm{s}, \mathrm{t}$ are distinct primes. Then:
$\operatorname{Ssc}(n \cdot m)=\operatorname{Ssc}\left(p^{a} \cdot q^{b} \cdot s^{c} \cdot t^{d}\right)=p^{\text {odd }(a)} \cdot q^{\text {odd }(b)} \cdot s^{\text {odd }(c)} \cdot t^{\text {odd }(d)}$
according to the theorem 4.

On the contrary:
$\operatorname{Ssc}(n)=\operatorname{Ssc}\left(p^{a} \cdot q^{b}\right)=p^{\operatorname{odd}(a)} \cdot q^{\operatorname{odd}(b)}$
$\operatorname{Ssc}(m)=\operatorname{Ssc}\left(s^{c} \cdot t^{d}\right)=s^{o d d(c)} \cdot t^{o d d(d)}$
This implies that: $\operatorname{Ssc}(n \cdot m)=\operatorname{Ssc}(n) \cdot \operatorname{Ssc}(m) \quad$ qed

Theorem 6: If $n=p^{a} \cdot q^{b} \cdot \ldots . . . . \cdot p^{s}$ then $\operatorname{Ssc}(n)=\operatorname{Ssc}\left(p^{a}\right) \cdot \operatorname{Ssc}\left(p^{b}\right) \cdot \ldots \ldots \cdot \operatorname{Ssc}\left(p^{s}\right) \quad$ where $p$ is any prime number.

According to the theorem 4:
$\operatorname{Ssc}(n)=p^{\text {odd }(a)} \cdot p^{\text {odd }(b)} \cdot \ldots \ldots \cdot p^{\text {odd }(s)}$
and:
$\operatorname{Ssc}\left(p^{a}\right)=p^{o d d(a)}$
$\operatorname{Ssc}\left(p^{b}\right)=p^{\text {odd }(b)}$
and so on. Then:

$$
\operatorname{Ssc}(n)=\operatorname{Ssc}\left(p^{a}\right) \cdot \operatorname{Ssc}\left(p^{b}\right) \cdot \ldots \ldots \cdot \cdot \operatorname{Ssc}\left(p^{s}\right) \quad \text { qed }
$$

Theorem 7: $\operatorname{Ssc}(n)=n$ if $n$ is squarefree, that is if the prime factors of $n$ are all distinct. All prime numbers, of course are trivially squarefree [3].

Without loss of generality let's suppose that $n=p \cdot q$ where p and q are two distinct primes. According to the theorems 5 and 3:
$\operatorname{Ssc}(n)=\operatorname{Ssc}(p \cdot q)=\operatorname{Ssc}(p) \cdot \operatorname{Ssc}(q)=p \cdot q=n \quad$ qed

Theorem 8: The Ssc(n) function is not additive. :
In fact for example: $\quad \operatorname{Ssc}(3+4)=\operatorname{Ssc}(7)=7\langle>\operatorname{Ssc}(3)+\operatorname{Ssc}(4)=3+1=4$

Anyway we can find numbers $m$ and $n$ such that the function $\operatorname{Ssc}(n)$ is additive. In fact if:
m and n are squarefree
$\mathrm{k}=\mathrm{m}+\mathrm{n}$ is squarefree.
then $\operatorname{Ssc}(\mathrm{n})$ is additive.
In fact in this case $\operatorname{Ssc}(\mathrm{m}+\mathrm{n})=\operatorname{Ssc}(\mathrm{k})=\mathrm{k}=\mathrm{m}+\mathrm{n}$ and $\operatorname{Ssc}(\mathrm{m})=\mathrm{m} \operatorname{Ssc}(\mathrm{n})=\mathrm{n}$ according to theorem 7 .

Theorem 9: $\quad \sum_{n=1}^{\infty} \frac{1}{\operatorname{Ssc}(n)}$ diverges

In fact:

$$
\sum_{n=1}^{\infty} \frac{1}{\operatorname{Ssc}(n)}>\sum_{p=2}^{\infty} \frac{1}{\operatorname{Ssc}(p)}=\sum_{p=2}^{\infty} \frac{1}{p} \quad \text { where } \mathrm{p} \text { is any prime number. }
$$

So the sum of inverse of $\operatorname{Ssc}(\mathrm{n})$ function diverges due to the well known divergence of series [3]:

$$
\sum_{p=2}^{\infty} \frac{1}{p}
$$

Theorem 10: $\operatorname{Ssc}(n)>0$ where $n=1,2,3,4 \ldots$
This theorem is a direct consequence of $\operatorname{Ssc}(\mathrm{n})$ function definition. In fact for any n the smallest m such that $m \cdot n$ is a perfect square cannot be equal to zero otherwise $m \cdot n=0$ and zero is not a perfect square.

Theorem 11: $\quad \sum_{n=1}^{\infty} \frac{\operatorname{Ssc}(n)}{n}$ diverges

In fact being $\operatorname{Ssc}(n) \geq 1$ this implies that:

$$
\sum_{n=1}^{\infty} \frac{S s c(n)}{n}>\sum_{n=1}^{\infty} \frac{1}{n}
$$

and as known the sum of reciprocal of integers diverges. [3]

Theorem 12: $\quad \operatorname{Ssc}(n) \leq n$

Direct consequence of theorem 4.

Theorem 13: The range of $\operatorname{Ssc}(n)$ function is the set of squarefree numbers.
According to the theorem 4 for any integer n the function $\operatorname{Ssc}(\mathrm{n})$ generates a squarefree number.

Theorem 14: $0<\frac{\operatorname{Ssc}(n)}{n} \leq 1 \quad$ for $n>=1$

Direct consequence of theorems 12 and 10.

Theorem 15: $\frac{\operatorname{Ssc}(n)}{n}$ is not distributed uniformly in the interval ]0,1]

If n is squarefree then $\operatorname{Ssc}(\mathrm{n})=\mathrm{n}$ that implies $\frac{\operatorname{Ssc}(n)}{n}=1$

If n is not squarefree let's suppose without loss of generality that $n=p^{a} \cdot q^{b}$ where p and q are primes.

Then:

$$
\frac{\operatorname{Ssc}(n)}{n}=\frac{\operatorname{Ssc}\left(p^{a}\right) \cdot \operatorname{Ssc}\left(p^{b}\right)}{p^{a} \cdot q^{b}}
$$

We can have 4 different cases.

1) a even and b even

$$
\frac{\operatorname{Ssc}(n)}{n}=\frac{\operatorname{Ssc}\left(p^{a}\right) \cdot \operatorname{Ssc}\left(p^{b}\right)}{p^{a} \cdot q^{b}}=\frac{1}{p^{a} \cdot q^{b}} \leq \frac{1}{4}
$$

2) a odd and b odd

$$
\frac{\operatorname{Ssc}(n)}{n}=\frac{\operatorname{Ssc}\left(p^{a}\right) \cdot \operatorname{Ssc}\left(p^{b}\right)}{p^{a} \cdot q^{b}}=\frac{p \cdot q}{p^{a} \cdot q^{b}}=\frac{1}{p^{a-1} \cdot q^{b-1}} \leq \frac{1}{4}
$$

3) a odd and b even

$$
\frac{\operatorname{Ssc}(n)}{n}=\frac{\operatorname{Ssc}\left(p^{a}\right) \cdot \operatorname{Ssc}\left(p^{b}\right)}{p^{a} \cdot q^{b}}=\frac{p \cdot 1}{p^{a} \cdot q^{b}}=\frac{1}{p^{a-1} \cdot q^{b}} \leq \frac{1}{4}
$$

4) a even and b odd

Analogously to the case 3 .

This prove the theorem because we don't have any point of $\operatorname{Ssc}(n)$ function in the interval $] 1 / 4,1[$

Theorem 16: For any arbitrary real number $\varepsilon>0$, there is some number $n>=1$ such that:

$$
\frac{\operatorname{Ssc}(n)}{n}<\varepsilon
$$

Without loss of generality let's suppose that $q=p_{1} \cdot p_{2}$ where $p_{1}$ and $p_{2}$ are primes such that $\frac{1}{q}<\varepsilon$ and $\varepsilon$ is any real number grater than zero. Now take a number n such that: $q$

$$
n=p_{1}^{a_{1}} \cdot p_{2}^{a_{2}}
$$

For $a_{1}$ and $a_{2}$ odd:

$$
\frac{\operatorname{Ssc}(n)}{n}=\frac{p_{1} \cdot p_{2}}{p_{1}^{a_{1}} \cdot p_{2}^{a_{2}}}=\frac{1}{p_{1}^{a_{1}-1} \cdot p_{2}^{a_{2}-1}}<\frac{1}{p_{1} \cdot p_{2}}<\varepsilon
$$

For $a_{1}$ and $a_{2}$ even:

$$
\frac{\operatorname{Ssc}(n)}{n}=\frac{1}{p_{1}^{a_{1}} \cdot p_{2}^{a_{2}}}<\frac{1}{p_{1} \cdot p_{2}}<\varepsilon
$$

For $a_{1}$ odd and $a_{2}$ even (or viceversa):

$$
\frac{\operatorname{Ssc}(n)}{n}=\frac{p_{1}}{p_{1}^{a_{1}} \cdot p_{2}^{a_{2}}}=\frac{1}{p_{1}^{a_{1}-1} \cdot p_{2}^{a_{2}}}<\frac{1}{p_{1} \cdot p_{2}}<\varepsilon
$$

Theorem 17: $\operatorname{Ssc}\left(p_{k} \#\right)=p_{k} \#$ where $p_{k} \#$ is the product of first k primes (primordial) [3].
The theorem is a direct consequence of theorem 7 being $p_{k} \#$ a squarefree number.

Theorem 18: The equation $\quad \frac{\operatorname{Ssc}(n)}{n}=1$ has an infinite number of solutions.

The theorem is a direct consequence of theorem 2 and the well-known fact that there is an infinite number of prime numbers [6]

Theorem 19: The repeated iteration of the Ssc(n) function will terminate always in a fixed point (see [3] for definition of a fixed point ).

According to the theorem 13 the application of Scc function to any $n$ will produce always a squarefree number and according to the theorem 7 the repeated application of Ssc to this squarefree number will produce always the same number.

Theorem 20: The diophantine equation $\operatorname{Ssc}(n)=S s c(n+1)$ has no solutions.
We must distinguish three cases:

1) $n$ and $n+1$ squarefree
2) $n$ and $n+1$ not squareefree
3) $n$ squarefree and $n+1$ no squarefree and viceversa

Case 1. According to the theorem $7 \operatorname{Ssc}(\mathrm{n})=\mathrm{n}$ and $\operatorname{Ssc}(\mathrm{n}+1)=\mathrm{n}+1$ that implies that $\operatorname{Ssc}(\mathrm{n})<>\operatorname{Ssc}(\mathrm{n}+1)$

Case 2. Without loss of generality let's suppose that:

$$
\begin{aligned}
& n=p^{a} \cdot q^{b} \\
& n+1=p^{a} \cdot q^{b}+1=s^{c} \cdot t^{d}
\end{aligned}
$$

where $\mathrm{p}, \mathrm{q}, \mathrm{s}$ and t are distinct primes.
According to the theorem 4:

$$
\begin{aligned}
& \operatorname{Ssc}(n)=\operatorname{Ssc}\left(p^{a} \cdot q^{b}\right)=p^{o d d(a)} \cdot q^{o d d(b)} \\
& \operatorname{Ssc}(n+1)=\operatorname{Ssc}\left(s^{c} \cdot t^{d}\right)=s^{\text {odd }(c)} \cdot t^{o d d(d)}
\end{aligned}
$$

and then $\operatorname{Ssc}(\mathrm{n})<>\operatorname{Ssc}(\mathrm{n}+1)$
Case 3. Without loss of generality let's suppose that $n=p \cdot q$. Then:

$$
\begin{aligned}
& \operatorname{Ssc}(n)=\operatorname{Ssc}(p \cdot q)=p \cdot q \\
& \operatorname{Ssc}(n+1)=\operatorname{Ssc}(p \cdot q+1)=\operatorname{Ssc}\left(s^{a} \cdot t^{b}\right)=s^{o d d(a)} \cdot t^{o d d(b)}
\end{aligned}
$$

supposing that $n+1=p \cdot q+1=s^{a} \cdot t^{b}$
This prove completely the theorem.

Theorem 21: $\quad \sum_{k=1}^{N} \operatorname{Ssc}(k)>\frac{6 \cdot N}{\pi^{2}}$ for any positive integer $N$.

The theorem is very easy to prove. In fact the sum of first N values of Ssc function can be separated into two parts:

$$
\sum_{k_{1}=1}^{N} S s c\left(k_{1}\right)+\sum_{k_{2}=1}^{N} S s c\left(k_{2}\right)
$$

where the first sum extend over all $k_{1}$ squarefree numbers and the second one over all $k_{2}$ not squarefree numbers.
According to the Hardy and Wright result [3], the asymptotic number $\mathrm{Q}(\mathrm{n})$ of squarefree numbers $\leq N$ is given by:

$$
Q(N) \approx \frac{6 \cdot N}{\pi^{2}}
$$

and then:

$$
\sum_{k=1}^{N} S s c(k)=\sum_{k_{1}=1}^{N} S s c\left(k_{1}\right)+\sum_{k_{2}=1}^{N} S s c\left(k_{2}\right)>\frac{6 \cdot N}{\pi^{2}}
$$

because according to the theorem 7, $\operatorname{Ssc}\left(k_{1}\right)=k_{1}$ and the sum of first N squarefree numbers is always greater or equal to the number $\mathrm{Q}(\mathrm{N})$ of squarefree numbers $\leq N$, namely:

$$
\sum_{k_{1}=1}^{N} k_{1} \geq Q(N)
$$

Theorem 22: $\quad \sum_{k=1}^{N} \operatorname{Ssc}(k)>\frac{N^{2}}{2 \cdot \ln (N)}$ for any positive integer $N$.

In fact:

$$
\sum_{k=1}^{N} S s c(k)=\sum_{k^{\prime}=1}^{N} S s c\left(k^{\prime}\right)+\sum_{p=2}^{N} S s c(p)>\sum_{p=2}^{N} S s c(p)
$$

because by theorem 2, $\operatorname{Ssc}(\mathrm{p})=\mathrm{p}$. But according to the result of Bach and Shallit [3], the sum of first N primes is asymptotically equal to:

$$
\frac{N^{2}}{2 \cdot \ln (N)}
$$

and this completes the proof.

Theorem 23: The diophantine equations $\frac{\operatorname{Ssc}(n+1)}{\operatorname{Ssc}(n)}=k$ and $\frac{\operatorname{Ssc}(n)}{\operatorname{Ssc}(n+1)}=k$ where $k$ is any integer number have an infinite number of solutions.

Let's suppose that n is a perfect square. In this case according to the theorem 1 we have:

$$
\frac{\operatorname{Ssc}(n+1)}{\operatorname{Ssc}(n)}=\operatorname{Ssc}(n+1)=k
$$

On the contrary if $n+1$ is a perfect square then:

$$
\frac{\operatorname{Ssc}(n)}{\operatorname{Ssc}(n+1)}=\operatorname{Ssc}(n)=k
$$

## Problems.

1) Is the difference $|\operatorname{Ssc}(\mathrm{n}+1)-\operatorname{Ssc}(\mathrm{n})|$ bounded or unbounded?
2) Is the $\operatorname{Ssc}(\mathrm{n})$ function a Lipschitz function?

A function is said a Lipschitz function [3] if:

$$
\frac{|S s c(m)-S s c(k)|}{|m-k|} \geq M \quad \text { where } \mathrm{M} \text { is any integer }
$$

3) Study the function $\operatorname{FSsc}(\mathrm{n})=\mathrm{m}$. Here m is the number of different integers k such that $\operatorname{Ssc}(\mathrm{k})=\mathrm{n}$.
4) Solve the equations $\operatorname{Ssc}(n)=\operatorname{Scc}(n+1)+\operatorname{Ssc}(n+2)$ and $\operatorname{Ssc}(n)+\operatorname{Ssc}(n+1)=\operatorname{Ssc}(n+2)$. Is the number of solutions finite or infinite?
5) Find all the values of $n$ such that $\operatorname{Ssc}(n)=\operatorname{Ssc}(n+1) \cdot \operatorname{Ssc}(n+2)$
6) Solve the equation $\operatorname{Ssc}(n) \cdot \operatorname{Ssc}(n+1)=\operatorname{Ssc}(n+2)$
7) Solve the equation $\operatorname{Ssc}(n) \cdot \operatorname{Ssc}(n+1)=\operatorname{Ssc}(n+2) \cdot \operatorname{Ssc}(n+3)$
8) Find all the values of n such that $S(n)^{k}+Z(n)^{k}=S s c(n)^{k}$ where $\mathrm{S}(\mathrm{n})$ is the Smarandache function [1], $\mathrm{Z}(\mathrm{n})$ the Pseudo-Smarandache function [2] and k any integer.
9) Find the smallest $k$ such that between $\operatorname{Ssc}(n)$ and $\operatorname{Ssc}(k+n)$, for $n>1$, there is at least a prime.
10) Find all the values of $n$ such that $\operatorname{Ssc}(Z(n))-Z(\operatorname{Ssc}(n))=0$ where $Z$ is the Pseudo Smarandache function [2].
11) Study the functions $\operatorname{Ssc}(Z(n)), Z(\operatorname{Ssc}(n))$ and $\operatorname{Ssc}(Z(n))-Z(\operatorname{Ssc}(n))$.
12) Evaluate $\lim _{k \rightarrow \infty} \frac{\operatorname{Ssc}(k)}{\theta(k)} \quad$ where $\theta(k)=\sum_{n \leq k} \ln (\operatorname{Ssc}(n))$
13) Are there $\mathrm{m}, \mathrm{n}, \mathrm{k}$ non-null positive integers for which $\operatorname{Ssc}(m \cdot n)=m^{k} \cdot \operatorname{Ssc}(n)$ ?
14) Study the convergence of the Smarandache Square complementary harmonic series:

$$
\sum_{n=1}^{\infty} \frac{1}{S s c^{a}(n)}
$$

where $\mathrm{a}>0$ and belongs to R
15) Study the convergence of the series:

$$
\sum_{n=1}^{\infty} \frac{x_{n+1}-x_{n}}{\operatorname{Ssc}\left(x_{n}\right)}
$$

where $x_{n}$ is any increasing sequence such that $\lim _{n \rightarrow \infty} x_{n}=\infty$
16) Evaluate:

$$
\lim _{n \rightarrow \infty} \frac{\sum_{k=2}^{n} \frac{\ln (S s c(k))}{\ln (k)}}{n}
$$

Is this limit convergent to some known mathematical constant?
17) Solve the functional equation:

$$
\operatorname{Ssc}(n)^{r}+\operatorname{Ssc}(n)^{r-1}+\ldots \ldots \ldots+\operatorname{Ssc}(n)=n
$$

where $r$ is an integer $\geq 2$.
18) What about the functional equation:

$$
\operatorname{Ssc}(n)^{r}+\operatorname{Ssc}(n)^{r-1}+\ldots \ldots \ldots+\operatorname{Ssc}(n)=k \cdot n
$$

where r and k are two integers $\geq 2$.
19) Evaluate $\sum_{k=1}^{\infty}(-1)^{k} \cdot \frac{1}{\operatorname{Ssc}(k)}$
20) Evaluate $\frac{\sum_{n} \operatorname{Ssc}(n)^{2}}{\left|\sum_{n} \operatorname{Ssc}(n)\right|^{2}}$
21) Evaluate:

$$
\lim _{n \rightarrow \infty}\left|\sum_{n} \frac{1}{S s c(f(n))}-\sum_{n} \frac{1}{f(S s c(n))}\right|
$$

for $\mathrm{f}(\mathrm{n})$ equal to the Smarandache function $\mathrm{S}(\mathrm{n})[1]$ and to the Pseudo-Smarandache function $\mathrm{Z}(\mathrm{n})$ [2].
