## Dedication

 А.Р.Котеллкои
## $\infty \times$

We dedicate this book to A.P. Kotelnikov. The algebra of dual numbers has been originally conceived by W.K. Clifford, but its first applications to mechanics are due to A.P. Kotelnikov. The original paper of A.P. Kotelnikov, published in the Annals of Imperial University of Kazan (1895), is reputed to have been destroyed during the Russian revolution.

## なo か

## PREFACE

In this book the authors introduce a new type of dual numbers called special dual like numbers.

These numbers are constructed using idempotents in the place of nilpotents of order two as new element. That is $\mathrm{x}=\mathrm{a}+\mathrm{bg}$ is a special dual like number where a and b are reals and $g$ is a new element such that $\mathrm{g}^{2}=\mathrm{g}$. The collection of special dual like numbers forms a ring. Further lattices are the rich structures which contributes to special dual like numbers. These special dual like numbers $\mathrm{x}=\mathrm{a}+\mathrm{bg}$; when a and b are positive reals greater than or equal to one we see powers of $x$ diverge on; and every power of $x$ is also a special dual like number, with very large $a$ and $b$. On the other hand if $a$ and $b$ are positive reals lying in the open interval $(0,1)$ then we see the higher powers of $x$ may converge to 0 .

Another rich source of idempotents is the Neutrosophic number I , as $\mathrm{I}^{2}=\mathrm{I}$. We build several types of finite or infinite rings using these Neutrosophic numbers. We also define the
notion of mixed dual numbers using both dual numbers and special dual like numbers. Neither lattices nor the Neutrosophic number I can contribute to mixed dual numbers. The two sources are the linear operators on vector spaces or linear algebras and the modulo integers $\mathrm{Z}_{\mathrm{n}}$; n a suitable composite number, are the ones which contribute to mixed dual numbers.

This book contains seven chapters. Chapter one is introductory in nature. Special dual like numbers are introduced in chapter two. Chapter three introduces higher dimensional special dual like numbers. Special dual like neutrosophic numbers are introduced in chapter four of this book. Mixed dual numbers are defined and described in chapter five and the possible applications are mentioned in chapter six. The last chapter has suggested over 145 problems.

We thank Dr. K.Kandasamy for proof reading and being extremely supportive.

## Chapter One

## INTRODUCTION

In this book the authors for the first time introduce the new notion of special dual like numbers. Dual numbers were introduced in 1873 by W.K. Clifford.

We call a number $\mathrm{a}+\mathrm{bg}$ to be a special dual like number if $\mathrm{a}, \mathrm{b} \in \mathrm{R}$ (or Q or $\mathrm{Z}_{\mathrm{n}}$ or C ) and g is a new element such that $\mathrm{g}^{2}=\mathrm{g}$.

We give examples of them.
The natural class of special dual like numbers can also be got from $\langle\mathrm{Z} \cup \mathrm{I}\rangle=\left\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}, \mathrm{I}^{2}=\mathrm{I}, \mathrm{I}\right.$ the indeterminate $\}$ $\left(\langle\mathrm{Q} \cup \mathrm{I}\rangle\right.$ or $\left\langle\mathrm{Z}_{\mathrm{n}} \cup \mathrm{I}\right\rangle$ or $\langle\mathrm{R} \cup \mathrm{I}\rangle$ or $\langle\mathrm{C} \cup \mathrm{I}\rangle$ ).

Thus introduction of special dual like numbers makes one identify these neutrosophic rings as special dual like numbers.

Apart from this in this book we use distributive lattices to build the special dual like numbers.

For $S=\{a+b g \mid a, b \in R$ and $g \in L, L$ a lattice $\}$ paves way to a special dual like number as $g \cap g=g$ and $g \cup g=g$ that is every element in L is an idempotent under both the operations
on L. However if we are using only two dimensional special dual like numbers we do not need the notion of distributivity in lattices. Only for higher dimensional special dual like numbers we need the concept of distributivity.

Further the modulo numbers $Z_{\mathrm{n}}$ are rich in idempotents leading one to construct special dual like numbers.

We in this book introduce another concept called the mixed dual numbers. We call $x=a_{1}+a_{2} g_{1}+a_{3} g_{2}, a_{1}, a_{2}, a_{3} \in Q$ (or $Z$ or $C$ or $Z_{n}$ or $R$ ) and $g_{1}$ and $g_{2}$ are new elements such that $g_{1}^{2}=$ 0 and $g_{2}^{2}=g_{2}$ with $g_{1} g_{2}=g_{2} g_{1}=0$ (or $g_{1}$ or $g_{2}$ 'or' used in the mutually exclusive sense) as a mixed dual number.

We generate mixed dual numbers only from $\mathrm{Z}_{\mathrm{n}}$. However we can use linear operators of vector spaces / linear algebras to get mixed dual numbers.

Study in this direction is also carried out. We construct mixed dual numbers of any dimension. However the dimension of mixed dual numbers are always greater than or equal to three. Only $Z_{n}$ 's happen to be a rich source of these mixed dual numbers. We have constructed other algebraic structures using these two new numbers.

For more about vector spaces, semivector spaces and rings refer [19-20].

## Chapter Two

## Special Dual Like Numbers

In this chapter we introduce a new notion called a special dual like number.

The special dual like numbers extend the real numbers by adjoining one new element $g$ with the property $g^{2}=g(g$ is an idempotent). The collection of special dual like numbers forms a particular two dimensional general ring.

A special dual like number has the form $\mathrm{x}=\mathrm{a}+\mathrm{bg}, \mathrm{a}, \mathrm{b}$ are reals, with $\mathrm{g}^{2}=\mathrm{g} ; \mathrm{g}$ a new element.

Example 2.1: Let $\mathrm{g}=4 \in \mathrm{Z}_{12}, \mathrm{a}, \mathrm{b} \in \mathrm{R}$ any real $\mathrm{x}=\mathrm{a}+\mathrm{bg}$ is a special dual like number

$$
\begin{aligned}
x^{2} & =(a+b g)(a+b g)=a^{2}+\left(2 a b+b^{2}\right) g \\
& =A+B g\left(\text { using } g^{2}=g\right) \text { only if } 2 a=-b(a s b \neq 0) .
\end{aligned}
$$

If $b=-2 a$ then we see $x=a-2 a g$ and $x^{2}=a^{2}+\left(4 a^{2}-4 a^{2}\right) g$ $=a^{2}$ only the real part of it.

However if $\mathrm{x}=\mathrm{a}+\mathrm{bg}$ and $\mathrm{y}=\mathrm{c}+\mathrm{dg}, \mathrm{xy} \neq \mathrm{bg}$ for any real a , $\mathrm{b}, \mathrm{c}, \mathrm{d}$ in R or Q or Z as $\mathrm{a} \neq 0 \mathrm{~b} \neq 0, \mathrm{c} \neq 0$ and $\mathrm{d} \neq 0$.

We just describe the operations on special dual like numbers.

Suppose $\mathrm{x}=\mathrm{a}_{1}+\mathrm{b}_{1} \mathrm{~g}$ and $\mathrm{y}=\mathrm{c}_{1}+\mathrm{d}_{1} \mathrm{~g}$ then
$x \pm y=\left(a_{1} \pm c_{1}\right)+\left(b_{1} \pm d_{1}\right) g$, the sum can be a special dual like number or a pure number. If $a_{1}= \pm c_{1}$ then $x \pm y$ is a pure part of the special dual like and is of the form $\left(b_{1} \pm d_{1}\right) g$.

If $\mathrm{b}_{1}= \pm \mathrm{d}_{1}$ then $\mathrm{x} \pm \mathrm{y}$ is a pure number $\mathrm{a}_{1} \pm \mathrm{c}_{1}$.

We see unlike dual numbers in case of pure part of dual like number the product is again a pure dual number as $\mathrm{g}^{2}=0$; where as in case of dual number the product will be zero as $\mathrm{g}^{2}=0$.

We will show by some simple examples.
Let $g=5 \in Z_{10}$ we see $g^{2}=g$. Consider $x=7+6 g$ and $y=-7+3 g$ any two special dual like numbers.
$\mathrm{x}+\mathrm{y}=9 \mathrm{~g}$ and $\mathrm{x}-\mathrm{y}=14+3 \mathrm{~g}$ so $\mathrm{x}+\mathrm{y}$ is a pure dual number where as $\mathrm{x}-\mathrm{y}$ is again special dual like number. Now take $x=7+6 \mathrm{~g}$ and $\mathrm{y}=-7+3 \mathrm{~g}$ we find the product of two special dual like numbers.

$$
\begin{aligned}
\mathrm{x} \times \mathrm{y} & =(7+6 \mathrm{~g}) \times(-7+3 \mathrm{~g}) \\
& =-49-42 \mathrm{~g}+21 \mathrm{~g}+18 \mathrm{~g}^{2} \quad\left(\because \mathrm{~g}=\mathrm{g}^{2}\right) \\
& =-49-3 \mathrm{~g} \text { is again a special dual like number. }
\end{aligned}
$$

This if $\mathrm{x}=\mathrm{a}+\mathrm{bg}$ and $\mathrm{y}=\mathrm{c}+\mathrm{dg}$ be any two special dual like numbers then $\mathrm{x} \times \mathrm{y}=(\mathrm{a}+\mathrm{bg})(\mathrm{c}+\mathrm{dg})=\mathrm{ac}+\mathrm{bcg}+\mathrm{dag}+\mathrm{bdg}^{2}$ $=a c+(b c+d a b d) g$.

Now the product of two special dual like numbers can never be a pure dual number for $\mathrm{ac} \neq 0$ as a and c are reals.

The product $x y$ is a real number only if $b c+d a+b d=0$, that is

$$
\begin{aligned}
& c+d=\frac{-d a}{b} \text { or } \\
& a+b=\frac{-b c}{d}
\end{aligned}
$$

For $(3+2 \mathrm{~g})(5-2 \mathrm{~g})=15$ so that it is a pure real number.
THEOREM 2.1: Let $x=a+b g$ be a given special dual like number where $g^{2}=g ; a, b \in R$. We have infinitely many $y=c+d g$ such that $x y=$ real and is not a special dual like number.

The proof is direct.
However for the reader to follow we give an example.
Example 2.2: Let $\mathrm{x}=3+5 \mathrm{~g}$ where $\mathrm{g}=3 \in \mathrm{Z}_{6}$ be a special dual like number.

$$
\begin{aligned}
& \text { Let } y=a+b g(a, b \in R), \text { such that } x y=A+0 g \\
& \begin{aligned}
\text { Consider } x \times y & =(3+5 g)(a+b g) \\
& =3 a+5 a g+3 b g+5 b g \\
& =3 a+g(5 a+8 b)
\end{aligned}
\end{aligned}
$$

Given $5 \mathrm{a}+8 \mathrm{~b}=0$ so that we get $5 \mathrm{a}=-8 \mathrm{~b}$ we have infinite number of non zero solutions.

Thus for a given special dual like number we can have infinite number of special dual like numbers such that the product is real that is only real part exist.

Further it is pertinent to mention the convention followed in this book.

If $x=a+b g\left(g=g^{2}\right) a, b \in R$ we call $a$ the pure part of the special dual like number and $b$ as the pure dual part of the special dual like number.

THEOREM 2.2: Let $x=a+b g$ be a special dual like number ( $a, b \in R \backslash\{0\}$ ) then for no special dual like number $y=c+d g$; $c, d \in R \backslash\{0\}$; we have the pure part of the product to be zero. That is the pure product of $x y$ is never zero.

Now we see this is not the case with ' + ' or ' - '.
For if $x=-7+8 g$ and $y=7-5 g$ be two special dual like numbers then $\mathrm{x}+\mathrm{y}=3 \mathrm{~g}$, this special dual like numbers sum has only pure dual part and pure part of $\mathrm{x}+\mathrm{y}$ is 0 .

However for a given $\mathrm{x}=\mathrm{a}+\mathrm{bg}$ we have a infinitely many $y=c+d g$ such that $x+y=0+(b+d) g$. This $y$ 's are defined as the additive inverse of the pure parts of $x$ and vice versa.

Similarly if $\mathrm{x}=3-5 \mathrm{~g}$ and $\mathrm{y}=8+5 \mathrm{~g}$ be any two special dual like numbers we see $\mathrm{x}+\mathrm{y}=11-(0) \mathrm{g}$ that is $\mathrm{x}+\mathrm{y}$ is only the pure part of the special dual like number.

Thus we have the following to be true. For every $x=a+b g$ there exists infinitely many $y ; y=c+d g$ such that $x+y=(a+c)$ $+(0) \mathrm{g}$ these y 's will be called as additive inverse of the x .

Now for a given special dual like number $x=a+b g$ we have a unique $\mathrm{y}=-\mathrm{a}-\mathrm{bg}$ such that $\mathrm{x}+\mathrm{y}=(0)+(0) \mathrm{g}$. This y is unique and is defined as the additive inverse of $x$.

Inview of all these we have the following theorem the proof of which is left as an exercise to the reader.

THEOREM 2.3: Let $x=a+b g$ be a special dual like number $g^{2}=g(a, b \in R$ or $Q$ or $Z)$.
(i) we have infinitely many $y=d+(-b) g ; d \in R \backslash\{0,-a\}$ such that $x+y=a+d+(0) g$ pure part.
(ii) for $x=a+b g$ are have infinitely may $y=-a+d g, d \in$ $R \backslash\{0,-b\}$ such that $x+y=0+(b+d) g$, the pure dual part.
(iii) for a given special dual like number $x=a+b g$ we have $a$ unique $y=-a-b g$ such that $x+y=(0)+(0) g$. This $y$ is defined as the additive inverse of $x$.

Now we proceed onto give some notations followed in this book.

$$
\begin{aligned}
& \mathrm{R}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{~b} \in \mathrm{R} ; \mathrm{g}^{2}=\mathrm{g}\right\}, \\
& \mathrm{Q}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{~b} \in \mathrm{Q}, \mathrm{~g}^{2}=\mathrm{g}\right\}, \\
& \mathrm{Z}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{~b} \in \mathrm{Z} \text { and } \mathrm{g}^{2}=\mathrm{g}\right\} \text { and } \\
& \mathrm{Z}_{\mathrm{n}}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{~b} \in \mathrm{Z}_{\mathrm{n}}, \mathrm{~g}^{2}=\mathrm{g} \text { and } \mathrm{p} \text { a prime }\right\} .
\end{aligned}
$$

Following these notation we see that
$R(g)=\{$ collection of all special dual like numbers $\}$.
Clearly $\mathrm{R} \subset \mathrm{R}(\mathrm{g})\left(\mathrm{Q}(\mathrm{g})\right.$ or $\mathrm{Z}(\mathrm{g})$ or $\mathrm{Z}_{\mathrm{n}}(\mathrm{g}), \mathrm{n}$ a prime and $\mathrm{g}^{2}=\mathrm{g}$ ).

THEOREM 2.4: $R(g)=\left\{a+b g \mid a, b \in R\right.$ where $\left.g^{2}=g\right\}$ be $Z_{n}(g)$ the collection of special dual like numbers, $R(g)$ is an abelian group under addition.

The proof is direct and hence left as an exercise to the reader.

Now we just see how product $\times$ occurs on the class of special dual like numbers.

Let $\mathrm{x}=\mathrm{a}+\mathrm{bg}$ and $\mathrm{y}=\mathrm{c}+\mathrm{dg}$ be any two special dual like numbers. $x y=a c+(a d+b c+d b) g$, we see if $a, b, c, d \in$ $\mathrm{R} \backslash\{0\}, \mathrm{xy} \neq(0)$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{R}(\mathrm{g})$. If a or $\mathrm{c}=0$ then $\mathrm{xy}=\mathrm{bdg}$
$\neq(0)$. If $b$ or $d=0$ then $x y=a c \neq(0)$. Thus $x y \neq(0)$ whatever be $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathrm{R} \backslash\{0\}$. However in the product xy the pure dual part can be zero if ad $+\mathrm{bc}+\mathrm{db}=0$.

Thus if $3+2 \mathrm{~g}=\mathrm{x}$ is a special dual like number then the inverse of x is a unique y such that $\mathrm{xy}=1+0(\mathrm{~g})$. That is $\mathrm{y}=$ $1 / 3-2 / 5 \mathrm{~g}$ is the special dual like number such that $\mathrm{xy}=(3+2 \mathrm{~g})$ ( $1 / 3-2 / 15 \mathrm{~g}$ )

$$
\begin{aligned}
=3 & \times \frac{1}{3}+\frac{29}{3}-\frac{3.2}{15} \mathrm{~g}-\frac{2.29}{15} \\
& =1+\left(\frac{2}{3}-\frac{6}{15}-\frac{4}{15}\right) \mathrm{g} \\
& =1+0 . \mathrm{g} \\
& =1 .
\end{aligned}
$$

But all elements in $\mathrm{R}(\mathrm{g})$ is not invertible. For take $5 \mathrm{~g} \in$ $\mathrm{R}(\mathrm{g})$ we do not have a y in $\mathrm{R}(\mathrm{g})$ such that $\mathrm{y} \times 5 \mathrm{~g}=1$. Hence only numbers of the for $\mathrm{x}=\mathrm{a}+\mathrm{bg}$ with $\mathrm{a}, \mathrm{b} \in \mathrm{R} \backslash\{0\}$ has inverse. If $b=0$ of course $x \in R$ has a unique inverse. If $a+$ $\mathrm{bg}, \mathrm{a} \neq-\mathrm{b}$ then only we have inverse.

Inview of all these observations we have the following theorems.

THEOREM 2.5: Let $R(g)$ (or $Q(g)$ ) be the collection of all special dual like numbers.
(i) Every $x \in\left\{a+b g \mid a, b \in R \backslash\{0\}\right.$ and $\left.g^{2}=g, a \neq-b\right\}$ has $a$ unique inverse with respect to product $x$.
(ii) $R(g)$ has zero divisors with respect to $x$.
(iii) $x \in\left\{b g \mid b \in R \backslash\{0\}, g^{2}=g\right\}$ has no inverse in $R(g)$.

The proof of this theorem is direct and need only simple number theoretic techniques. All element $\mathrm{a}-\mathrm{ag}$ are zero divisors for $(a-a g) g=a g-a g=0$.

THEOREM 2.6: Let $R(g)(Q(g)$ or $Z(g))$ be the collection of all special dual like numbers $(R(g), x)$ is a semigroup and has zero divisors.

This proof is also direct and hence left as an exercise to the reader.

Theorem 2.7: Let

$$
(R(g), x,+)=\left\{a+b g \mid a, b \in R, g^{2}=g, x,+\right\} .\{R(g), x,+)
$$ is a commutative ring with unit $1=1+0 . g$.

This proof is also direct.
Corollary 2.1: $(\mathrm{R}(\mathrm{g}),+, \times)$ is not an integral domain.
We can have for $g$ matrices which are idempotent linear operators or g can be the elements of the standard basis of a vector space.

We will illustrate these situations by some examples.

## Example 2.3: Let

$$
R(g)=\{a+b g \mid g=(1,1,0,0,1,1,0,1) ; a, b \in R\}
$$

be the general ring of special dual like numbers.

## Example 2.4: Let

$$
\begin{aligned}
& \mathrm{Q}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \left\lvert\, \mathrm{g}=\left(\begin{array}{llll}
1 & 0 & 1 & 0 \\
1 & 1 & 0 & 1
\end{array}\right)\right.,\right. \\
& \left.\mathrm{g} \times_{\mathrm{n}} \mathrm{~g}=\left(\begin{array}{llll}
1 & 0 & 1 & 0 \\
1 & 1 & 0 & 1
\end{array}\right), \mathrm{a}, \mathrm{~b} \in \mathrm{Q}\right\}
\end{aligned}
$$

be the general ring of special dual like numbers.

Example 2.5: Let

$$
\mathrm{Z}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \left\lvert\, \mathrm{g}=\left[\begin{array}{l}
1 \\
0 \\
1 \\
0 \\
1
\end{array}\right]\right., \mathrm{g} \times_{\mathrm{n}} \mathrm{~g}=\left[\begin{array}{l}
1 \\
0 \\
1 \\
0 \\
1
\end{array}\right], \mathrm{a}, \mathrm{~b} \in \mathrm{Z}\right\}
$$

be the general ring of special dual like numbers.
Example 2.6: Let

$$
\mathrm{Z}_{5}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \left\lvert\, \mathrm{g} \times \mathrm{g}=\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right) \times\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right)=\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right)\right.\right\}
$$

is the general ring of special dual like numbers. $\mathrm{Z}_{5}(\mathrm{~g})$ has zero divisors, for $1+4 \mathrm{~g}, \mathrm{~g} \in \mathrm{Z}_{5}(\mathrm{~g})$ and $\mathrm{g}(1+4 \mathrm{~g})=\mathrm{g}+4 \mathrm{~g}=5 \mathrm{~g}=0$ $(\bmod 5)$ as $\mathrm{g}^{2}=\mathrm{g}$.

## Example 2.7: Let

$$
\mathrm{Z}_{11}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{~b} \in \mathrm{Z}_{11}, \mathrm{~g}=\left(\begin{array}{llllll}
1 & 1 & 1 & 1 & 10
\end{array}\right)\right\}
$$

be a general ring of special dual numbers.
$\quad(1+10 \mathrm{~g}) \mathrm{g}=\mathrm{g}+10 \mathrm{~g} \equiv 0(\bmod 11)$. Thus g is a zero divisor
in $\mathrm{Z}_{11}(\mathrm{~g})$.

Inview of this we have the following theorem.
THEOREM 2.8: Let $Z_{p}(g)=\left\{a+b g \mid g^{2}=g\right.$ and $\left.a, b \in Z_{p}\right\}$ be $a$ general ring of special dual numbers. $Z_{p}(g)$ is of finite order and has zero divisors.

Proof: Clearly order of $Z_{p}(g)$ is $p^{2}$ and for $1+(p-1) g$ and $g \in$ $\mathrm{Z}_{\mathrm{p}}(\mathrm{g})$ we have $(1+(\mathrm{p}-1) \mathrm{g}) \mathrm{g}=\mathrm{g}+(\mathrm{p}-1) \mathrm{g} \equiv 0(\bmod \mathrm{p})$ as $\mathrm{g}^{2}=0$. Hence the claim.

Suppose $\mathrm{t}+\mathrm{rg}$ and g are in $\mathrm{Z}_{\mathrm{p}}(\mathrm{g})$ with $\mathrm{t}+\mathrm{r} \equiv \mathrm{p} \equiv 0(\bmod \mathrm{p})$ we see $(\mathrm{t}+\mathrm{rg}) \mathrm{g}=\operatorname{tg}+\mathrm{rg} \equiv 0(\bmod \mathrm{p})$. It is pertinent to note that in $\mathrm{R}(\mathrm{g})$ all element of the form $\mathrm{a}-\mathrm{ag}, \mathrm{a} \in \mathrm{R} \backslash\{0\}$ are zero divisors for $(a-a g) \times g=a g-a g=0$ as $g^{2}=0$.

Inview of all these we have the following result.
THEOREM 2.9: Let $R(g)\left(Z(g)\right.$ or $Q(g)$ or $\left.Z_{p}(g)\right)$ be general special dual like number ring. $R(g)$ has zero divisors and infact $g$ is a zero divisor.

Proof: We know $\mathrm{a}-\mathrm{ag} \in \mathrm{R}(\mathrm{g})$ where $\mathrm{a} \in \mathrm{R} \backslash\{0\}$.
We see $\mathrm{g} \in \mathrm{R}(\mathrm{g})($ as $1-\mathrm{g}=\mathrm{g} .1=\mathrm{g})(\mathrm{a}-\mathrm{ag}) \mathrm{g}=\mathrm{ag}-\mathrm{ag} \equiv 0$ as $\mathrm{g}^{2}=0$. Hence the claim.

Now we have the following observations about special dual like number general rings.

Example 2.8: $\operatorname{Let~}_{\mathrm{Z}}^{7}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{g}=(1,1,0,1,0), \mathrm{a}, \mathrm{b} \in \mathrm{Z}_{7}\right\}$ be a ring of $7^{2}$ elements. $Z_{7}(\mathrm{~g})$ is the general special dual like number ring.

Consider $\mathrm{S}=\{1+6 \mathrm{~g}, 6+\mathrm{g}, 2+5 \mathrm{~g}, 5+2 \mathrm{~g}, 3+4 \mathrm{~g}, 4+3 \mathrm{~g}, 0\}$ is a subring of $\mathrm{Z}_{7}(\mathrm{~g})$. Clearly $1+6 \mathrm{~g} \in \mathrm{~S}$ is an idempotent of S as $(1+6 \mathrm{~g})^{2}=1+6 \mathrm{~g}+6 \mathrm{~g}+36 \mathrm{~g}(\bmod 7)$.

$$
=1+6 \mathrm{~g}+6 \mathrm{~g}+\mathrm{g}=1+6 \mathrm{~g} .
$$

Infact $1+6 \mathrm{~g}$ generates the subring as

$$
\begin{aligned}
& 1+6 \mathrm{~g}+1+6 \mathrm{~g}=2+5 \mathrm{~g}(\bmod 7) \\
& 1+6 \mathrm{~g}+2+5 \mathrm{~g}=3+4 \mathrm{~g}(\bmod 7) \\
& 3+4 \mathrm{~g}+1+6 \mathrm{~g}=4+3 \mathrm{~g}(\bmod 7) \\
& 4+3 \mathrm{~g}+1+6 \mathrm{~g}=5+2 \mathrm{~g}(\bmod 7) \\
& 5+2 \mathrm{~g}+1+6 \mathrm{~g}=6+\mathrm{g}(\bmod 7) \\
& 6+\mathrm{g}+1+6 \mathrm{~g}=0(\bmod 7) .
\end{aligned}
$$

Hence $1+6 \mathrm{~g}$ generates $S$ additively.
Infact $1+6 \mathrm{~g}$ acts as the multiplicative identity.

For $(1+6 \mathrm{~g})(\mathrm{s})=\mathrm{s}$ for all $\mathrm{s} \in \mathrm{S}$.
Consider $\mathrm{P}=\{0, \mathrm{~g}, 2 \mathrm{~g}, 3 \mathrm{~g}, 4 \mathrm{~g}, 5 \mathrm{~g}, 6 \mathrm{~g}\} \subseteq \mathrm{Z}_{7}(\mathrm{~g})$. It is easily verified $P$ is also a subring and $g$ acts as the multiplicative identity.

$$
\begin{aligned}
& \text { For } 2 \mathrm{~g} \times 4 \mathrm{~g}=\mathrm{g}(\bmod 7) \\
& 3 \mathrm{~g} \times 5 \mathrm{~g}=\mathrm{g}(\bmod 7) \\
& 6 \mathrm{~g} \times 6 \mathrm{~g}=\mathrm{g}(\bmod 7)
\end{aligned}
$$

So 2 g is the inverse of 4 g with g as its identity and so on.
Likewise in S we see for $(2+5 \mathrm{~g}) ;(4+3 \mathrm{~g})$ is its inverse as $(2+5 \mathrm{~g})(4+3 \mathrm{~g})=1+6 \mathrm{~g}$.

$$
\begin{aligned}
& (6+g)(6+g)=1+6 g . \\
& (5+2 g)(3+4 g)=1+6 g
\end{aligned}
$$

So for $5+2 \mathrm{~g} ; 3+4 \mathrm{~g}$ is its inverse.
We see the subrings $S$ and $P$ are such that
$\mathrm{S} \times \mathrm{P}=\{\mathrm{sp} \mid$ for all $\mathrm{s} \in \mathrm{S}$ and $\mathrm{p} \in \mathrm{P}\}=\{0\}$. We call such subrings as orthogonal subrings. Infact these two are fields of order 7 and infact their product is zero.

Let $\mathrm{M}=\{1+\mathrm{g}, 2+2 \mathrm{~g}, 3+3 \mathrm{~g}, 4+4 \mathrm{~g}, 5+5 \mathrm{~g}, 6+6 \mathrm{~g}, 0\} \subseteq \mathrm{Z}_{7}(\mathrm{~g})$. M is an abelian group under addition how ever it is not multiplicatively closed.

$$
\text { For }(1+\mathrm{g})^{3}=1 \text { and } 1 \notin \mathrm{M} .
$$

$$
\begin{aligned}
& \text { Also }(1+\mathrm{g})^{2}=1+3 \mathrm{~g} \notin \mathrm{M} . \\
& (3+2 \mathrm{~g})^{3}=1 \text { and }(2+2 \mathrm{~g})^{2}=4+5 \mathrm{~g} \notin \mathrm{M} . \\
& (3+3 \mathrm{~g})^{2}=2+6 \mathrm{~g} \notin \mathrm{M} . \\
& (3+3 \mathrm{~g})^{3}=6 \notin \mathrm{M} . \\
& (4+4 \mathrm{~g})^{2}=2+6 \mathrm{~g} \notin \mathrm{M} . \\
& (4+4 \mathrm{~g})^{3}=1 . \\
& (6+6 \mathrm{~g})^{3}=6 \notin \mathrm{M} .
\end{aligned}
$$

$$
\begin{aligned}
& \text { Consider } 4+5 \mathrm{~g} \in \mathrm{Z}_{7}(\mathrm{~g}) \\
& (4+5 \mathrm{~g})^{2}=2+2 \mathrm{~g} \\
& (4+5 \mathrm{~g})^{3}=1
\end{aligned}
$$

For $5+4 \mathrm{~g} \in \mathrm{Z}_{7}(\mathrm{~g})$ we have $3+\mathrm{g} \in \mathrm{Z}_{7}(\mathrm{~g})$ is such that $(5+4 \mathrm{~g})(3+\mathrm{g})=1(\bmod 7)$.

Thus $\mathrm{Z}_{7}(\mathrm{~g})$ has units subrings, orthogonal subrings and zero divisors.

Example 2.9: $\operatorname{Let~}_{\mathrm{Z}_{5}}(\mathrm{~g})=\left\{\mathrm{a}+\mathrm{bg} \mid 5=\mathrm{g} \in \mathrm{Z}_{20}, \mathrm{a}, \mathrm{b} \in \mathrm{Z}_{5}\right\}$ be the general ring of special dual like numbers.

Take $\mathrm{S}=\{0,1+4 \mathrm{~g}, 2+3 \mathrm{~g}, 3+2 \mathrm{~g}, 4+\mathrm{g}\} \subseteq \mathrm{Z}_{5}(\mathrm{~g}), \mathrm{S}$ is a subring of $Z_{5}(\mathrm{~g})$.
$\mathrm{M}=\{0, \mathrm{~g}, 2 \mathrm{~g}, 3 \mathrm{~g}, 4 \mathrm{~g}\} \subseteq \mathrm{Z}_{5}(\mathrm{~g})$ is also a subring of $\mathrm{Z}_{5}(\mathrm{~g})$.
Take $\mathrm{P}=\{0,1,2,3,4\} \subseteq \mathrm{Z}_{5}(\mathrm{~g})$ is a subring.
$P$ is not an ideal of $Z_{5}(\mathrm{~g})$. M is an ideal of $\mathrm{Z}_{5}(\mathrm{~g})$.
Consider the subring T generated by $1+\mathrm{g} ; \mathrm{T}=\{0,1+\mathrm{g}$, $2+2 \mathrm{~g}, 3+3 \mathrm{~g}, 4+4 \mathrm{~g}, 1+3 \mathrm{~g}, 4+2 \mathrm{~g}, 2+4 \mathrm{~g}, 3+\mathrm{g}, 1+2 \mathrm{~g}, 1,2,3,4$, $2+\mathrm{g}, 3+4 \mathrm{~g}, 3 \mathrm{~g}, \mathrm{~g}, 2 \mathrm{~g}, 4 \mathrm{~g}, 1+4 \mathrm{~g}, 4+\mathrm{g}, 2+3 \mathrm{~g}, 3+2 \mathrm{~g}, 4+3 \mathrm{~g}\}$.

Now in view of these two examples we have the following result.

Theorem 2.10: Let

$$
Z_{p}(g)=\left\{a+b g \mid a, b \in Z_{p}, p \text { a prime, } g^{2}=g\right\}
$$

be the general ring of special dual like numbers.
(i) $S=\{0, g, \ldots,(p-1) g\} \subseteq Z_{p}(g)$ is a subring of $Z_{p}(g)$ which is also an ideal of $Z_{p}(a)$.
(ii) $T=\{0,1,2, \ldots, p-1\} Z_{p} \subseteq Z_{p}(g)$, is a subring of $Z_{p}(g)$ which is not an ideal.
(iii) $P=\left\{a+b g \mid a+b \equiv 0(\bmod p), a, b \in Z_{p}(g) \backslash\{0\}\right\} \subseteq Z_{p}(g)$ is a subring as well as an ideal of $Z_{p}(g)$.
(iv) As subrings (or ideals) $P$ and $S$ are orthogonal P.S. $=(0)$. $P \cap S=\{0\}$ but $P+S \neq Z_{p}(g)$.

The proof is direct and hence is left as an exercise to the reader.

Consider $\mathrm{R}(\mathrm{g})=\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{b} \in \mathrm{R} ; \mathrm{g}$ the new element such that $\left.\mathrm{g}^{2}=\mathrm{g}\right\}$; the general ring of special dual like numbers.

R the set of reals. Taking the reals on the x -axis and g's on $y$ axis we get the plane called the special plane of dual like numbers.

Suppose $-4-3 \mathrm{~g}, 2-\mathrm{g},-4+4 \mathrm{~g}$ and $5+3 \mathrm{~g}$ are special dual like numbers then we plot them in the special dual like plane as follows.

We call the $y$-axis as $g$-axis.
Now consider the line $1-\mathrm{g}, 2-2 \mathrm{~g}, 3-3 \mathrm{~g}, 4-4 \mathrm{~g}, \ldots, 0,-1+\mathrm{g}$, $-2+2 \mathrm{~g},-3+3 \mathrm{~g},-4+4 \mathrm{~g}, \ldots$, then this can be plotted as follows:

We see in this set represented by the line $-\mathrm{a}+\mathrm{ag}$ and $\mathrm{a}-\mathrm{ag}$ for all $\mathrm{a} \in \mathrm{R}^{+}$every element mg on the g -axis is such that $\mathrm{mg} \times(-\mathrm{a}+\mathrm{ag})=-\mathrm{mag}+\mathrm{mag}\left(\right.$ as $\left.^{2}=\mathrm{g}\right)=0$.

Likewise $\mathrm{mg}(\mathrm{a}-\mathrm{ag})=0$.
Further the set $S=\left\{-a+a g \mid a \in R^{+}\right\}$is a subring of $R(g)$ known as the orthogonal like line of the line $\{ \pm \mathrm{mg} \mid \mathrm{m} \in \mathrm{R}\}=$ P , the g -axis. Further the g -axis is also a subring of $\mathrm{R}(\mathrm{g})$.

$$
\text { P. } \mathrm{S}=\{0\} \text { and } \mathrm{P} \cap \mathrm{~S}=\{0\} .
$$

This is another feature of the special dual like numbers which is entirely different from dual numbers.

Now we proceed onto explore other properties related with special dual like numbers.

We can have special dual like number matrices where the matrices will take its entries from $\mathrm{R}(\mathrm{g})$ or $\mathrm{Q}(\mathrm{g})$ or $\mathrm{Z}(\mathrm{g})$ or $\mathrm{Z}_{\mathrm{p}}(\mathrm{g})$.

Now we can also form polynomials with special dual like number coefficients $R(g)[x]=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{i} \in R(g)\right\} ; R(g)[x]$ is a ring called the general ring of polynomial special dual like number coefficients.

Now we will illustrate how special dual like number matrices with examples.

## Example 2.10: Let

$$
M=\left\{\left(a_{1}, a_{2}, a_{3}, a_{4}, a_{5}\right) \mid a_{i}=x_{i}+y_{i} g \in R(g) ; g^{2}=g, 1 \leq i \leq 5\right\}
$$

be the collection of row matrices with entries from $R(g) M$ will be also known as the special dual like number row matrices.

We can write $\mathrm{M}_{1}=\left\{\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}, \mathrm{x}_{4}, \mathrm{x}_{5}\right)+\left(\mathrm{y}_{1}, \mathrm{y}_{2}, \mathrm{y}_{3}, \mathrm{y}_{4}, \mathrm{y}_{5}\right) \mathrm{g} \mid\right.$ $x_{i}, y_{i} \in R ; 1 \leq i \leq 5$ and $\left.g^{2}=g\right\}$. Clearly both are isomorphic as general ring of special dual like numbers.

$$
\begin{aligned}
& \text { If } A=(5+2 \mathrm{~g}, 3-\mathrm{g}, 4+2 \mathrm{~g}, 0,1+\mathrm{g}) \text { and } \\
& \quad \mathrm{B}=(8+\mathrm{g}, 3 \mathrm{~g}, 0,4+\mathrm{g}, 1+3 \mathrm{~g}) \text { are in } \mathrm{M} \text { then } \\
& \begin{array}{r}
\mathrm{A}=(5,3,4,0,1)+(2,-1,2,0,1) \mathrm{g} \in \mathrm{M}_{1} . \\
B=(8,0,0,4,1)+(1,3,0,1,3) \mathrm{g} \in \mathrm{M}_{1} .
\end{array} \\
& \begin{array}{r}
\text { Now } \mathrm{A}+\mathrm{B}
\end{array} \mathrm{=}(13+3 \mathrm{~g}, 3+2 \mathrm{~g}, 4+2 \mathrm{~g}, 4+\mathrm{g}, 2+4 \mathrm{~g}) \\
& \quad=(13,3,4,4,2)+(3 \mathrm{~g}, 2 \mathrm{~g}, 2 \mathrm{~g}, \mathrm{~g}, 4 \mathrm{~g}) .
\end{aligned}
$$

$$
\begin{aligned}
\text { Also } \mathrm{A}+\mathrm{B}= & (5,3,4,0,1)+(8,0,0,4,1)+ \\
& {[(2,-1,2,0,1)+(1,3,0,14)] \mathrm{g} . } \\
= & (13,3,4,4,2)+(3,2,2,1,4) \mathrm{g}
\end{aligned}
$$

We see $A+B \in M\left(M_{1}\right)$.

$$
\begin{aligned}
\text { Now } \mathrm{A} \times \mathrm{B}= & (40,0,0,0,1)+(2,-3,0,0,3) \mathrm{g}+ \\
& (5,9,0,0,3) \mathrm{g}+(16,0,0,0,1) \\
= & (40,0,0,0,1)+(23,6,0,0,7) \mathrm{g} .
\end{aligned}
$$

Now $\mathrm{A} \times \mathrm{B}=((5+2 \mathrm{~g})(8+\mathrm{g}),(3-\mathrm{g}) 3 \mathrm{~g}$,

$$
\begin{aligned}
& (4+2 \mathrm{~g}) 0,0 \times(4+\mathrm{g}),(1+\mathrm{g})(1+3 \mathrm{~g})) \\
= & (40+23 \mathrm{~g}, 6 \mathrm{~g}, 0,0,1+7 \mathrm{~g}) .
\end{aligned}
$$

Thus both ways the product is the same. $\left(M\left(M_{1}\right),+, \times\right)$ is the general ring of special dual like numbers of row matrices.

## Example 2.11: Let

$$
M=\left\{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4} \\
a_{5} \\
a_{6}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g, x_{i}, y_{i} \in Q ; 1 \leq i \leq 6 \text { and } g=\left(\begin{array}{cc}
1 & 0 \\
0 & 0
\end{array}\right)\right\}
$$

be the general ring of special dual like number column matrices.

26 Special Dual like Numbers and Lattices

$$
\text { Let } \mathrm{A}=\left[\begin{array}{c}
3+8 \mathrm{~g} \\
-2+\mathrm{g} \\
1+4 \mathrm{~g} \\
0 \\
-8 \mathrm{~g} \\
6
\end{array}\right] \text { and } \mathrm{B}=\left[\begin{array}{c}
2 \mathrm{~g} \\
-4 \\
0 \\
6+\mathrm{g} \\
1-\mathrm{g} \\
-5+2 \mathrm{~g}
\end{array}\right]
$$

be any two elements in M.

$$
\begin{gathered}
\mathrm{A}+\mathrm{B}=\left[\begin{array}{c}
3+10 \mathrm{~g} \\
-6+\mathrm{g} \\
1+4 \mathrm{~g} \\
6+\mathrm{g} \\
1-9 \mathrm{~g} \\
1+2 \mathrm{~g}
\end{array}\right] \in \mathrm{M} . \\
\mathrm{A} \times \mathrm{B}=\left[\begin{array}{c}
(3+8 \mathrm{~g}) 2 \mathrm{~g} \\
(-2+\mathrm{g})-4 \\
(1+4 \mathrm{~g}) \times 0 \\
0 \times(6+\mathrm{g}) \\
-8 \mathrm{~g}(1-\mathrm{g}) \\
6 \times(-5+2 \mathrm{~g})
\end{array}\right]=\left[\begin{array}{c}
22 \mathrm{~g} \\
-8-4 \mathrm{~g} \\
0 \\
0 \\
0 \\
-30+12 \mathrm{~g}
\end{array}\right] .
\end{gathered}
$$

Now A can be represented as

$$
\begin{aligned}
& A=\left[\begin{array}{c}
3 \\
-2 \\
1 \\
0 \\
0 \\
6
\end{array}\right]+\left[\begin{array}{c}
8 \\
1 \\
4 \\
0 \\
-8 \\
0
\end{array}\right] g \text { and B is represented as } \\
& B=\left[\begin{array}{c}
0 \\
-4 \\
0 \\
6 \\
1 \\
-5
\end{array}\right]+\left[\begin{array}{c}
2 \\
0 \\
0 \\
1 \\
-1 \\
2
\end{array}\right] g . \\
& \text { Now AB }=\left[\begin{array}{c}
3 \\
-2 \\
1 \\
0 \\
0 \\
6
\end{array}\right]\left[\begin{array}{c}
0 \\
-4 \\
0 \\
6 \\
1 \\
-5
\end{array}\right]+\left[\begin{array}{c}
8 \\
1 \\
4 \\
0 \\
-8 \\
0
\end{array}\right]\left[\begin{array}{c}
2 \\
0 \\
0 \\
1 \\
-1 \\
2
\end{array}\right] \mathrm{g}^{2}+ \\
& {\left[\begin{array}{c}
3 \\
-2 \\
1 \\
0 \\
0 \\
6
\end{array}\right]\left[\begin{array}{c}
2 \\
0 \\
0 \\
1 \\
-1 \\
2
\end{array}\right] \mathrm{g}+\left[\begin{array}{c}
8 \\
1 \\
4 \\
0 \\
-8 \\
0
\end{array}\right]\left[\begin{array}{c}
0 \\
-4 \\
0 \\
6 \\
1 \\
-5
\end{array}\right] \mathrm{g}}
\end{aligned}
$$

$28 \mid$ Special Dual like Numbers and Lattices

$$
\begin{aligned}
& =\left[\begin{array}{c}
0 \\
8 \\
0 \\
0 \\
0 \\
-30
\end{array}\right]+\left[\begin{array}{c}
16+6+0 \\
0+0-4 \\
0+0+0 \\
0+0+0 \\
8+0-8 \\
0+12+0
\end{array}\right] \mathrm{g} \\
& =\left[\begin{array}{c}
0 \\
8 \\
0 \\
0 \\
0 \\
-30
\end{array}\right]+\left[\begin{array}{c}
22 \\
-4 \\
0 \\
0 \\
0 \\
12
\end{array}\right] \mathrm{g} .
\end{aligned}
$$

Thus we see we can write

$$
\mathrm{A}=\left[\begin{array}{c}
3+8 \mathrm{~g} \\
-2+\mathrm{g} \\
1+4 \mathrm{~g} \\
0 \\
-8 \mathrm{~g} \\
6
\end{array}\right]=\left[\begin{array}{c}
3 \\
-2 \\
1 \\
0 \\
0 \\
6
\end{array}\right]+\left[\begin{array}{c}
8 \\
1 \\
4 \\
0 \\
-8 \\
0
\end{array}\right] \mathrm{g} .
$$

Both the representations are identical or one and the same.
Now we give examples of a general ring of special dual like number square matrices.

Example 2.12: Let

$$
\begin{aligned}
& S=\left\{\left.\left(\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right) \right\rvert\, \text { where } a_{i}=x_{i}+y_{i} g \in Q(g) \text { with } x_{i}, y_{i} \in Q,\right. \\
& g=\left(\begin{array}{llll}
1 & 0 & 0 & 1 \\
0 & 1 & 1 & 0
\end{array}\right), g^{2}=\left(\begin{array}{llll}
1 & 0 & 0 & 1 \\
0 & 1 & 1 & 0
\end{array}\right) \times{ }_{\mathrm{n}}\left(\begin{array}{llll}
1 & 0 & 0 & 1 \\
0 & 1 & 1 & 0
\end{array}\right) \\
& \left.=\left(\begin{array}{llll}
1 & 0 & 0 & 1 \\
0 & 1 & 1 & 0
\end{array}\right)=\mathrm{g} ; 1 \leq \mathrm{i} \leq 9\right\}
\end{aligned}
$$

be the general ring of special dual like number square matrices.

$$
\begin{gathered}
\text { Let } \mathrm{A}=\left(\begin{array}{ccc}
8-\mathrm{g} & 9 \mathrm{~g} & 0 \\
1+5 \mathrm{~g} & 2 & -3+2 \mathrm{~g} \\
0 & -4-\mathrm{g} & 1+3 \mathrm{~g}
\end{array}\right) \text { and } \\
\mathrm{B}=\left(\begin{array}{ccc}
0 & 2 & 7+9 \mathrm{~g} \\
3-\mathrm{g} & \mathrm{~g} & 5 \\
-7+2 \mathrm{~g} & \mathrm{~g}+1 & 0
\end{array}\right) \in \mathrm{S} . \\
\text { Now } \mathrm{A}+\mathrm{B}=\left(\begin{array}{ccc}
8-\mathrm{g} & 2+9 \mathrm{~g} & 7+9 \mathrm{~g} \\
4+4 \mathrm{~g} & 2+\mathrm{g} & 2+2 \mathrm{~g} \\
-7+2 \mathrm{~g} & -3 & 1+3 \mathrm{~g}
\end{array}\right) \text { is in } \mathrm{S} .
\end{gathered}
$$

Now we can define two types of products on $S$, natural product $\times_{n}$ and usual product $\times$. Under natural product $\times_{n}$, $S$ is a commutative ring and where as under usual product $\times, S$ is a non commutative ring.

We will illustrate both the situations.

30 Special Dual like Numbers and Lattices
$A x_{n} B=B x_{n} A$ for all $A, B \in S$. Thus $\left(S,+, x_{n}\right)$ is a commutative ring.

Now we find $\mathrm{A} \times \mathrm{B}=$

$$
\left.\begin{array}{c}
\left(\begin{array}{cc}
8-\mathrm{g} \times 0+9 \mathrm{~g} \times 3-\mathrm{g}+0 \times-7+2 \mathrm{~g} & 8-\mathrm{g} \times 2+9 \mathrm{~g} \times \mathrm{g}+0 \times \mathrm{g}+1 \\
1+5 \mathrm{~g} \times 0+2 \times 3-\mathrm{g}+-3+2 \mathrm{~g} \times-7+2 \mathrm{~g} & 1+5 \mathrm{~g} \times 2+2 \mathrm{~g}+-3+2 \mathrm{~g} \times \mathrm{g}+1 \\
0 \times 0+-4-\mathrm{g} \times 3-\mathrm{g}+1+3 \mathrm{~g} \times-7+2 \mathrm{~g} & 0 \times 2+-4-\mathrm{g} \times \mathrm{g}+1+3 \mathrm{~g} \times \mathrm{g}+1
\end{array}\right. \\
8-\mathrm{g} \times 7+9 \mathrm{~g}+9 \mathrm{~g} \times 5+0 \times 0 \\
1+5 \mathrm{~g} \times 7+9 \mathrm{~g}+2 \times 5+-3+2 \mathrm{~g} \times 0 \\
0 \times 7+9 \mathrm{~g}-4-\mathrm{g} \times 5+1+3 \mathrm{~g} \times 0
\end{array}\right) \mathrm{t} \begin{aligned}
& 16+7 \mathrm{~g} \\
& 56+101 \mathrm{~g} \\
& =\left(\begin{array}{ccc}
18 \mathrm{~g} & 17 \\
27-18 \mathrm{~g} & -1+13 \mathrm{~g} & 17+89 \mathrm{~g} \\
-19-11 \mathrm{~g} & 1+2 \mathrm{~g} & -20-5 \mathrm{~g}
\end{array}\right) \quad \text { is in } \mathrm{S} .
\end{aligned}
$$

Clearly $\mathrm{A} \times \mathrm{B} \neq \mathrm{A} \times \mathrm{B}$, further it is easily verified $A \times B \neq B \times A$.

Now we can write A as

$$
\begin{aligned}
\mathrm{A} & =\left(\begin{array}{ccc}
8-\mathrm{g} & 9 \mathrm{~g} & 0 \\
1+5 \mathrm{~g} & 2 & -3+2 \mathrm{~g} \\
0 & -4-\mathrm{g} & 1+3 \mathrm{~g}
\end{array}\right) \\
& =\left(\begin{array}{ccc}
8 & 0 & 0 \\
1 & 2 & -3 \\
0 & -4 & 1
\end{array}\right)+\left(\begin{array}{ccc}
-1 & 9 & 0 \\
5 & 0 & 2 \\
0 & -1 & 3
\end{array}\right) \mathrm{g} \\
\text { and } \mathrm{B} & =\left(\begin{array}{ccc}
0 & 2 & 7+9 \mathrm{~g} \\
3-\mathrm{g} & \mathrm{~g} & 5 \\
-7+2 \mathrm{~g} & \mathrm{~g}+1 & 0
\end{array}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\left(\begin{array}{ccc}
0 & 2 & 7 \\
3 & 0 & 5 \\
-7 & 1 & 0
\end{array}\right)+\left(\begin{array}{ccc}
0 & 0 & 9 \\
-1 & 1 & 0 \\
2 & 1 & 0
\end{array}\right) \mathrm{g} . \\
& \text { Now } A \times_{n} B=\left(\begin{array}{ccc}
8 & 0 & 0 \\
1 & 2 & -3 \\
0 & -4 & 1
\end{array}\right)+\left(\begin{array}{ccc}
0 & 2 & 7 \\
3 & 0 & 5 \\
-7 & 1 & 0
\end{array}\right) \\
& +\left(\begin{array}{ccc}
8 & 0 & 0 \\
1 & 0 & 3 \\
0 & -4 & 1
\end{array}\right) \times\left(\begin{array}{ccc}
0 & 0 & 9 \\
-1 & 1 & 0 \\
2 & 1 & 0
\end{array}\right) g+ \\
& \left(\begin{array}{ccc}
-1 & 9 & 0 \\
5 & 0 & 2 \\
0 & -1 & 3
\end{array}\right) \times\left(\begin{array}{ccc}
0 & 2 & 7 \\
3 & 0 & 5 \\
-7 & 1 & 0
\end{array}\right) g+ \\
& \left(\begin{array}{ccc}
-1 & 9 & 0 \\
5 & 0 & 2 \\
0 & -1 & 3
\end{array}\right) \times\left(\begin{array}{ccc}
0 & 0 & 9 \\
-1 & 1 & 0 \\
2 & 1 & 0
\end{array}\right) g \\
& =\left(\begin{array}{ccc}
0 & 0 & 0 \\
3 & 2 & -15 \\
0 & -4 & 0
\end{array}\right)+\left(\begin{array}{ccc}
0 & 0 & 0 \\
-1 & 2 & 0 \\
0 & -4 & 0
\end{array}\right) \mathrm{g}+ \\
& \left(\begin{array}{ccc}
0 & 18 & 0 \\
15 & 0 & 10 \\
0 & -1 & 0
\end{array}\right) g+\left(\begin{array}{ccc}
0 & 0 & 0 \\
-5 & 0 & 0 \\
0 & -1 & 0
\end{array}\right) g
\end{aligned}
$$

32 Special Dual like Numbers and Lattices

$$
=\left(\begin{array}{ccc}
0 & 0 & 0 \\
3 & 2 & -15 \\
0 & -4 & 0
\end{array}\right)+\left(\begin{array}{ccc}
0 & 18 & 0 \\
9 & 2 & 10 \\
0 & -6 & 0
\end{array}\right) \mathrm{g} .
$$

Now both way natural products are the same

$$
\begin{aligned}
& \mathrm{A} \times \mathrm{B}= \\
& \left(\begin{array}{ccc}
8 & 0 & 0 \\
1 & 2 & -3 \\
0 & -4 & 1
\end{array}\right) \times\left(\begin{array}{ccc}
0 & 2 & 7 \\
3 & 0 & 5 \\
-7 & 1 & 0
\end{array}\right)+\left(\begin{array}{ccc}
8 & 0 & 0 \\
1 & 2 & -3 \\
0 & -4 & 1
\end{array}\right) \times\left(\begin{array}{ccc}
0 & 0 & 9 \\
-1 & 1 & 0 \\
2 & 1 & 0
\end{array}\right) g+ \\
& \left(\begin{array}{ccc}
-1 & 9 & 0 \\
5 & 0 & 2 \\
0 & -1 & 3
\end{array}\right) \times\left(\begin{array}{ccc}
0 & 2 & 7 \\
3 & 0 & 5 \\
-7 & 1 & 0
\end{array}\right) g+\left(\begin{array}{ccc}
-1 & 9 & 0 \\
5 & 0 & 2 \\
0 & -1 & 3
\end{array}\right) \times\left(\begin{array}{ccc}
0 & 0 & 9 \\
-1 & 1 & 0 \\
2 & 1 & 0
\end{array}\right) g \\
& =\left(\begin{array}{ccc}
0 & 16 & 56 \\
27 & -1 & 17 \\
-19 & 1 & -20
\end{array}\right)+\left(\begin{array}{ccc}
0 & 0 & 72 \\
-8 & -1 & 9 \\
6 & -3 & 0
\end{array}\right) \mathrm{g}+ \\
& \left(\begin{array}{ccc}
27 & -2 & 38 \\
-14 & 12 & 35 \\
-24 & 3 & -5
\end{array}\right) g+\left(\begin{array}{ccc}
-9 & 9 & -9 \\
4 & 2 & 45 \\
7 & 2 & 0
\end{array}\right) g \\
& =\left(\begin{array}{ccc}
0 & 16 & 56 \\
27 & -1 & 17 \\
-19 & 1 & -20
\end{array}\right)+\left(\begin{array}{ccc}
18 & 7 & 101 \\
-18 & 13 & 89 \\
-11 & 2 & -5
\end{array}\right) g
\end{aligned}
$$

is the same as $\mathrm{A} \times \mathrm{B}$ taken the other way.

Example 2.13: Let

$$
\begin{gathered}
P=\left\{\left.\left(\begin{array}{lllll}
a_{1} & a_{2} & a_{3} & a_{4} & a_{5} \\
a_{6} & a_{7} & a_{8} & a_{9} & a_{10}
\end{array}\right) \right\rvert\, a_{i}=x_{i}+y_{i} g \in Q(g),\right. \\
\left.g=3 \in Z_{6}, x_{i}, y_{i} \in Q ; 1 \leq i \leq 10\right\}
\end{gathered}
$$

be the general ring of special dual like number $2 \times 5$ matrix. $\left(\mathrm{P},+, x_{n}\right)$ is a commutative ring.

$$
\text { Let } \begin{aligned}
\mathrm{A} & =\left(\begin{array}{ccccc}
2+\mathrm{g} & 3 & -4+2 \mathrm{~g} & 0 & \mathrm{~g} \\
0 & 5-\mathrm{g} & 0 & 1+7 \mathrm{~g} & 3-2 \mathrm{~g}
\end{array}\right) \text { and } \\
\mathrm{B} & =\left(\begin{array}{ccccc}
0 & 8 \mathrm{~g} & 3-\mathrm{g} & 0 & 1+5 \mathrm{~g} \\
1+\mathrm{g} & 7 & 0 & 2+7 \mathrm{~g} & -5
\end{array}\right)
\end{aligned}
$$

be two elements of P .

$$
\mathrm{A}+\mathrm{B}=\left(\begin{array}{ccccc}
2+\mathrm{g} & 3+8 \mathrm{~g} & -1+\mathrm{g} & 0 & 1+6 \mathrm{~g} \\
1+\mathrm{g} & 12-\mathrm{g} & 0 & 3+14 \mathrm{~g} & -2-2 \mathrm{~g}
\end{array}\right) \in \mathrm{P}
$$

$\mathrm{A} \times_{\mathrm{n}} \mathrm{B}=$

$$
\left(\begin{array}{ccccc}
0 & 24 \mathrm{~g} & -4+2 \mathrm{~g} \times 3-\mathrm{g} & 0 & \mathrm{~g} \times 1+5 \mathrm{~g} \\
0 & 5-\mathrm{g} \times 7 & 0 \times 0 & 1+7 \mathrm{~g} \times 2+7 \mathrm{~g} & 3-2 \mathrm{~g} \times-5
\end{array}\right)
$$

$$
=\left(\begin{array}{ccccc}
0 & 24 \mathrm{~g} & -12+8 \mathrm{~g} & 0 & 6 \mathrm{~g} \\
0 & 35-7 \mathrm{~g} & 0 & 2+70 \mathrm{~g} & -15+10 \mathrm{~g}
\end{array}\right)
$$

Now A can also be written as

$$
A=\left(\begin{array}{ccccc}
2 & 3 & -4 & 0 & 0 \\
0 & 5 & 0 & 1 & 3
\end{array}\right)+\left(\begin{array}{ccccc}
1 & 0 & 2 & 0 & 1 \\
0 & -1 & 0 & 7 & -2
\end{array}\right) g \text { and }
$$

$$
\begin{aligned}
& B=\left(\begin{array}{ccccc}
0 & 0 & 3 & 0 & 1 \\
1 & 7 & 0 & 2 & -5
\end{array}\right)+\left(\begin{array}{ccccc}
0 & 8 & -1 & 0 & 5 \\
1 & 0 & 0 & 7 & 0
\end{array}\right) . \\
& \text { Now } A \times_{n} B=\left(\begin{array}{ccccc}
2 & 3 & -4 & 0 & 0 \\
0 & 5 & 0 & 1 & 3
\end{array}\right) \times\left(\begin{array}{ccccc}
0 & 0 & 3 & 0 & 1 \\
1 & 7 & 0 & 2 & -5
\end{array}\right)+ \\
& \left(\begin{array}{ccccc}
2 & 3 & -4 & 0 & 0 \\
0 & 5 & 0 & 1 & 3
\end{array}\right) \times\left(\begin{array}{ccccc}
0 & 8 & -1 & 0 & 5 \\
1 & 0 & 0 & 7 & 0
\end{array}\right)+ \\
& \left(\begin{array}{ccccc}
1 & 0 & 2 & 0 & 1 \\
0 & -1 & 0 & 7 & -2
\end{array}\right) \times\left(\begin{array}{ccccc}
0 & 0 & 3 & 0 & 1 \\
1 & 7 & 0 & 2 & -5
\end{array}\right) \mathrm{g}+ \\
& \left(\begin{array}{ccccc}
1 & 0 & 2 & 0 & 1 \\
0 & -1 & 0 & 7 & -2
\end{array}\right) \times\left(\begin{array}{ccccc}
0 & 8 & -1 & 0 & 5 \\
1 & 0 & 0 & 7 & 0
\end{array}\right) g \\
& =\left(\begin{array}{ccccc}
0 & 0 & -12 & 0 & 0 \\
0 & 35 & 0 & 2 & -15
\end{array}\right)+\left(\begin{array}{ccccc}
0 & 24 & 4 & 0 & 0 \\
0 & 0 & 0 & 7 & 0
\end{array}\right) g+ \\
& \left(\begin{array}{ccccc}
0 & 0 & 6 & 0 & 1 \\
0 & -7 & 0 & 14 & 10
\end{array}\right) g+\left(\begin{array}{ccccc}
0 & 0 & -2 & 0 & 5 \\
0 & 0 & 0 & 49 & 0
\end{array}\right) g \\
& =\left(\begin{array}{ccccc}
0 & 0 & -12 & 0 & 0 \\
0 & 35 & 0 & 2 & -15
\end{array}\right)+\left(\begin{array}{ccccc}
0 & 24 & 8 & 0 & 6 \\
0 & -7 & 0 & 70 & 10
\end{array}\right) \mathrm{g} .
\end{aligned}
$$

We use the second method for the simplification is easy. Thus we see both are the equivalent way of representation.

Now having seen examples of general ring of special dual like number matrices we now represent when the entries are from $\mathrm{Z}_{\mathrm{p}}(\mathrm{g})$.

Let
$Z_{p}(g)=\left\{a+b g \mid a, b \in Z_{p}, g\right.$ is a new element such that $\left.\mathrm{g}^{2}=0\right\}$ be the general modulo integer ring of special dual like numbers.

We now give examples of them.

## Example 2.14: Let

$$
\mathrm{V}=\left\{\left.\mathrm{a}+\mathrm{b}\left[\begin{array}{ccc}
12 & 0 & 0 \\
0 & 12 & 12 \\
12 & 12 & 12 \\
12 & 0 & 12
\end{array}\right] \right\rvert\, a, b \in Z_{5}, 12 \in \mathrm{Z}_{132},\right.
$$

12 is the new element as $\left.12^{2} \equiv 12(\bmod 132)\right\}$
be the general modulo integer ring of special dual like numbers. V is finite, that is V has only finite number of elements in it.

## Example 2.15: Let

$$
\begin{aligned}
& S=\left\{\left(a_{1}, a_{2}, a_{3}\right)+\left(b_{1}, b_{2}, b_{3}\right) g \mid a_{i}, b_{j} \in Z_{11},\right. \\
&\left.1 \leq i, j \leq 3, g=\left(\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right) \text { where } 3 \in Z_{9}\right\}
\end{aligned}
$$

be the general modulo integer ring of dual numbers.
Suppose

$$
\begin{aligned}
& x=(3,7,2)+(5,10,0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \text { and } \\
& y=(8,2,10)+(3,4,2)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \in S .
\end{aligned}
$$

36 | Special Dual like Numbers and Lattices

We see

$$
\begin{aligned}
x+y= & (0,9,1)+(8,3,2)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \text { and } \\
x \times y= & (3,7,2)(8,2,10)+(3,7,2)(3,4,2)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+ \\
& (5,10,0)(8,2,10)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+ \\
& (5,10,0)(3,4,2)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \\
= & (2,3,9)+(9,6,4)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+ \\
& (7,9,0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+(0,0,0) \\
= & (2,3,9)+(5,4,4)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] .
\end{aligned}
$$

Thus S is a ring of finite order and of characteristic eleven. $S$ has zero divisors, units, subrings and ideals.

Take $\mathrm{I}=\left\{(\mathrm{a}, 0,0)+(a, 0,0)\left[\begin{array}{ll}3 & 0 \\ 0 & 3\end{array}\right] a \in \mathrm{Z}_{11}\right\} \subseteq \mathrm{S}, \mathrm{I}$ is an ideal of S .

Consider $\mathrm{M}=\left\{\left.(\mathrm{a}, 0,0)+(0, \mathrm{~b}, 0) \times\left[\begin{array}{ll}3 & 0 \\ 0 & 3\end{array}\right] \right\rvert\, \mathrm{a}, \mathrm{b} \in \mathrm{Z}_{11}\right\} \subseteq \mathrm{S}$ is only a group under ' + ' of $S$.

$$
\begin{aligned}
& \text { For } x=(a, 0,0)+(0, b, 0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \text { and } \\
& y=(c, 0,0)+(0, d, 0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \text { we have } x+y \in M . \\
& \text { But } x \times y=(a, 0,0)(c, 0,0)+(a, 0,0)(0, d, 0) \times\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+ \\
& (0, b, 0)(c, 0,0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+ \\
& \quad(0, b, 0)(0, d, 0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \\
& =(a c, 0,0)+(0, b d, 0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] .
\end{aligned}
$$

$M$ is only a subring as $M$ is a semigroup under ' + '.
Take $\mathrm{z}=\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right)+\left(\mathrm{y}_{1}, \mathrm{y}_{2}, \mathrm{y}_{3}\right)\left[\begin{array}{ll}3 & 0 \\ 0 & 3\end{array}\right]$

$$
\begin{aligned}
\text { now } \mathrm{xz} & =\left(\mathrm{ax}_{1}, 0,0\right)+\left(\mathrm{ay}_{1}, 0,0\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+\left(0, \mathrm{x}_{2} \mathrm{~b}, 0\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \\
& =(\mathrm{ax}, 0,0)+\left(\mathrm{ay}_{1}, \mathrm{x}_{2} \mathrm{~b}, 0\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] .
\end{aligned}
$$

Clearly $\mathrm{xz} \notin \mathrm{M}$. Thus M is a subring and not an ideal of S .

$$
\text { Let } \mathrm{x}=(0, \mathrm{a}, 0)+(\mathrm{b}, 0,0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]
$$

$$
\text { and } y=(0,0, c)+(0,0, d)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]
$$

be in S. Clearly $\mathrm{x} \times \mathrm{y}=(0,0,0)+(0,0,0)\left[\begin{array}{ll}3 & 0 \\ 0 & 3\end{array}\right]=0$.
Thus $\mathrm{x}, \mathrm{y}$ are zero divisors in S for different $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathrm{Z}_{11}$.
However we compare this with $\left[\begin{array}{ll}3 & 0 \\ 0 & 3\end{array}\right]$ where $3 \in \mathrm{Z}_{6}$. Clearly

$$
\begin{gathered}
T=\left\{\left(a_{1}, a_{2}, a_{3}\right)+\left(b_{1}, b_{2}, b_{3}\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \text { where } a_{i}, b_{j} \in Z_{11},\right. \\
1 \leq i, j \leq 3,3 \in Z_{6} \text { so that } \\
\left.\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \times\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]=\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]\right\}
\end{gathered}
$$

is a general ring of special dual like numbers.
Now consider $\mathrm{P}=\left\{\left.(\mathrm{a}, 0,0)+(\mathrm{b}, 0,0)\left[\begin{array}{ll}3 & 0 \\ 0 & 3\end{array}\right] \right\rvert\, \mathrm{a}, \mathrm{b} \in \mathrm{Z}_{11}\right\} \subseteq \mathrm{T}$. Is P is an ideal of T ?

Now $(\mathrm{P},+$ ) is an abelian group.
$(\mathrm{P}, \times)$ is a semigroup. So $(\mathrm{P},+, \times) \subseteq(\mathrm{T},+, \times)$ is a subring.
$\operatorname{Consider} \mathrm{z}=\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right)+\left(\mathrm{y}_{1}, \mathrm{y}_{2}, \mathrm{y}_{3}\right)\left[\begin{array}{ll}3 & 0 \\ 0 & 3\end{array}\right] \in \mathrm{T}$ and

$$
\begin{gathered}
\text { let } x=(a, 0,0)+(b, 0,0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \in P . \\
\text { Now } x z=\left(x_{1} a, 0,0\right)+\left(y_{1} b, 0,0\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+ \\
\left(a_{1} 00\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+\left(x_{1} b, 0,0\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \\
=\left(x_{1} a, 0,0\right)+\left(y_{1} b+a y_{1}+x_{1} b(\bmod 11), 0,0\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \in P\right.
\end{gathered}
$$

has P is an ideal of T .
Consider

$$
\mathrm{N}=\left\{(\mathrm{x}, 0,0)+(0, \mathrm{y}, 0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \text { where } \mathrm{x}, \mathrm{y} \in \mathrm{Z}_{11}\right\} \subseteq \mathrm{T}
$$

Is N an ideal of T ?
We see $(\mathrm{N},+)$ is an additive abelian group.
Further $(\mathrm{N}, \times)$ is a semigroup under $\times$.
However for $\mathrm{s} \in \mathrm{T}$ and $\mathrm{n} \in \mathrm{N}$ we see $\mathrm{sn} \notin \mathrm{T}$, that is if

$$
\begin{aligned}
& \mathrm{s}=\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right)+\left(\mathrm{y}_{1}, \mathrm{y}_{2}, \mathrm{y}_{3}\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \\
& \text { and } \mathrm{n}=(\mathrm{x}, 0,0)+(0, \mathrm{y}, 0)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]
\end{aligned}
$$

$$
\begin{aligned}
& \text { Then } \mathrm{sn}=\left(\mathrm{x}_{1} \mathrm{x}, 0,0\right)+\left(\mathrm{xy}_{1}, 0,0\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+ \\
& \quad\left[0, \mathrm{x}_{2} \mathrm{y}, 0\right]\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right]+\left(0, \mathrm{y}_{2}, 0\right)\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \\
& =\left(\begin{array}{lll}
x_{1} x & 0 & 0
\end{array}\right)+\left(\mathrm{xy}_{1}, x_{2} y+y y_{2}, 0\right) \times\left[\begin{array}{ll}
3 & 0 \\
0 & 3
\end{array}\right] \notin \mathrm{N} .
\end{aligned}
$$

Thus N is only a subring and not an ideal of T .
Thus we have compared how the general ring of special dual like numbers and general ring of dual number behave.

## Example 2.16: Let

$$
\begin{array}{r}
\mathrm{M}=\left\{\begin{array}{l}
\left.\left\{\begin{array}{l}
a_{1} \\
\mathrm{a}_{2} \\
\mathrm{a}_{3} \\
\mathrm{a}_{4} \\
\mathrm{a}_{5}
\end{array}\right]+\left[\begin{array}{l}
\mathrm{b}_{1} \\
\mathrm{~b}_{2} \\
\mathrm{~b}_{3} \\
\mathrm{~b}_{4} \\
\mathrm{~b}_{5}
\end{array}\right](4,9,0,4,9) \right\rvert\, 4,9 \in \mathrm{Z}_{12} \text { and } \\
\left.\mathrm{b}_{\mathrm{i}}, \mathrm{a}_{\mathrm{j}} \in \mathrm{Z}_{19}, 1 \leq \mathrm{i}, \mathrm{j} \leq 5\right\}
\end{array}\right.
\end{array}
$$

be a general ring of special dual like numbers.

We just show how this has zero divisors under the natural product $\times_{n}$ of $M$.
$M$ is finite and $M$ has zero divisors and $M$ is commutative.

0 \\
0 \\
0
\end{array}\right]+\left[\begin{array}{l}
0 \\
0 \\
0 \\
0 \\
0
\end{array}\right](4,9,0,4,9) \in \mathrm{M} .
\end{aligned}
$$

Thus M has zero divisors.
We can easily verify $M$ has ideals and subrings which are not ideals.

Example 2.17: Let $\mathrm{S}=$

$$
\left\{\begin{array}{r}
{\left.\left[\begin{array}{ccc}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9} \\
a_{10} & a_{11} & a_{12}
\end{array}\right]+\left[\begin{array}{ccc}
b_{1} & b_{2} & b_{3} \\
b_{4} & b_{5} & b_{6} \\
b_{7} & b_{8} & b_{9} \\
b_{10} & b_{11} & b_{12}
\end{array}\right]\left[\begin{array}{l}
4 \\
9 \\
0 \\
4 \\
0
\end{array}\right] \right\rvert\, a_{i}, b_{j} \in Z_{2}, 4,} \\
\left.9 \in Z_{12}, 1 \leq i, j \leq 12\right\}
\end{array}\right.
$$

be a commutative general ring of special dual like numbers.

$$
\begin{gathered}

0 & 4 & 9 & 0
\end{array}\right] \in \mathrm{V} .
\end{aligned}
$$

Cleary $\mathrm{xy} \neq \mathrm{yx}$, this leads to a non commutative general ring of special dual like numbers.

Example 2.19: Let $\mathrm{M}=\left\{\left(\mathrm{a}_{\mathrm{ij}}\right)+\left(\mathrm{b}_{\mathrm{ij}}\right) \mathrm{g} \mid \mathrm{g}\right.$ is a new element such that $\mathrm{g}^{2}=\mathrm{g}$ and $\left(\mathrm{a}_{\mathrm{ij}}\right)$ and $\left(\mathrm{b}_{\mathrm{ij}}\right)$ are $7 \times 7$ matrices with entries from $\left.Z_{3}\right\}$ be a general non commutative ring of special dual like numbers.

Clearly M is of finite order of characteristic three and has subrings which are not ideals, one sided ideals, ideals and zero divisors.

If on $M$ we define the natural product $x_{n}$ then $M$ becomes a commutative general ring of special dual like numbers.

Next we proceed onto define vector spaces using special dual like numbers.

Recall if
$X=\left\{a+b g \mid g\right.$ is a new element such that $g^{2}=g$ and $\left.a, b \in Q\right\}$, X is an additive abelian group.

$$
V=\left\{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4}
\end{array}\right]+\left[\begin{array}{l}
b_{1} \\
b_{2} \\
b_{3} \\
b_{4}
\end{array}\right] g \right\rvert\, \text { where } g^{2}=g, a_{i}, b_{j} \in R, 1 \leq i, j \leq 4\right\}
$$

is again an additive abelian group.

$$
\text { Let } S=\left\{\left(a_{1}, a_{2}, \ldots, a_{10}\right)+\left(b_{1}, b_{2}, \ldots, b_{10}\right) g \mid g^{2}=g, a_{i}, b_{j} \in\right.
$$ Q with $1 \leq \mathrm{i}, \mathrm{j} \leq 10\}$ is again an additive abelian group.

$$
\begin{aligned}
& M=\left\{\left[\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{7} \\
a_{8} & a_{9} & \ldots & a_{14} \\
a_{15} & a_{16} & \ldots & a_{21}
\end{array}\right]\left[\begin{array}{cccc}
b_{1} & b_{2} & \ldots & b_{7} \\
b_{8} & b_{9} & \ldots & b_{14} \\
b_{15} & b_{16} & \ldots & b_{21}
\end{array}\right]|g| g^{2}=g ;\right. \\
& \left.\mathrm{a}_{\mathrm{i}}, \mathrm{~b}_{\mathrm{j}} \in \mathrm{Q}, 1 \leq \mathrm{i}, \mathrm{j} \leq 21\right\}
\end{aligned}
$$

is again an additive abelian group.
Finally $P=\left\{\begin{array}{lll}{\left[\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9}\end{array}\right]\left[\begin{array}{lll}b_{1} & b_{2} & b_{3} \\ b_{4} & b_{5} & b_{6} \\ b_{7} & b_{8} & b_{9}\end{array}\right]|g| g^{2}=g ; ~ ; ~ ; ~}\end{array}\right]$

$$
\left.\mathrm{a}_{\mathrm{i}}, \mathrm{~b}_{\mathrm{j}} \in \mathrm{Q}, 1 \leq \mathrm{i}, \mathrm{j} \leq 9\right\}
$$

is again an abelian group under addition.
Now using these additive groups if define vector spaces over the appropriate fields then we define these vector spaces as special dual like number vector spaces. If there is some product compatible on them we define them as special dual like number linear algebras.

We will illustrate this situation by some examples.
Example 2.20: Let $\mathrm{V}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}\right)+\left(\mathrm{b}_{1}, \mathrm{~b}_{2}\right)\right.$ where $\mathrm{g}=10 \in \mathrm{Z}_{30}$, $\mathrm{g}^{2}=(100) \bmod 30=10=\mathrm{g}$ and $\left.\mathrm{a}_{\mathrm{i}}, \mathrm{b}_{\mathrm{j}} \in \mathrm{Q}, 1 \leq \mathrm{i} \leq 2\right\}$ be a special dual like number vector space over the field Q .

V has $\mathrm{W}=\left\{\left(\mathrm{a}_{1}, 0\right)+\left(\mathrm{b}_{1}, 0\right) \mathrm{g} \mid \mathrm{a}_{1}, \mathrm{~b}_{1} \in \mathrm{Q} ; \mathrm{g}^{2}=\mathrm{g}=10 \in \mathrm{Z}_{30}\right\}$ $\subseteq \mathrm{V}$ and $\mathrm{P}=\left\{(0, \mathrm{a})+(0, \mathrm{~b}) \mathrm{g} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Q} ; \mathrm{g}^{2}=\mathrm{g}=10 \in \mathrm{Z}_{30}\right\} \subseteq \mathrm{V}$ as subspaces, that is special dual like number vector subspaces of V over the field Q.

Clearly $\mathrm{W} \cap \mathrm{P}=(0)$ and $\mathrm{W}+\mathrm{P}=\mathrm{V}$, that is V the direct sum of subspaces of V .

## Example 2.21: Let

$$
P=\left\{\left[\begin{array}{c}
a_{1} \\
a_{2} \\
\vdots \\
a_{7}
\end{array}\right]\left[\begin{array}{c}
b_{1} \\
b_{2} \\
\vdots \\
b_{7}
\end{array}\right] g \text { g } a_{i}, b_{j} \in Q, 1 \leq i, j \leq 7\right. \text { and }
$$

$$
\left.\mathrm{g}=(4,9), 4,9 \in \mathrm{Z}_{12}, \mathrm{~g}^{2}=(4,9)^{2}=(16,81)(\bmod 12)=(4,9)=9\right\}
$$

be a special dual number vector space over the field Q .
Consider

$$
\mathrm{M}_{1}=\left\{\left.\left[\begin{array}{l}
\mathrm{a}_{1} \\
\mathrm{a}_{2} \\
\mathrm{a}_{3} \\
0 \\
0 \\
0 \\
0
\end{array}\right]+\left[\begin{array}{c}
\mathrm{b}_{1} \\
\mathrm{~b}_{2} \\
\mathrm{~b}_{3} \\
0 \\
0 \\
0 \\
0
\end{array}\right] \mathrm{g} \right\rvert\, \mathrm{a}_{\mathrm{i}}, \mathrm{~b}_{\mathrm{j}} \in \mathrm{Q} ; 1 \leq \mathrm{i}, \mathrm{j} \leq 3, \mathrm{~g}=(4,9)\right\} \subseteq \mathrm{P},
$$

$M_{1}$ is a special dual number like vector subspace of $P$ over $Q$.

Let

$$
\mathrm{M}_{2}=\left\{\left[\begin{array}{c}
0 \\
0 \\
0 \\
a_{1} \\
a_{2} \\
0 \\
0
\end{array}\right]+\left[\begin{array}{c}
0 \\
0 \\
0 \\
b_{1} \\
b_{2} \\
0 \\
0
\end{array}\right] g \mathrm{a}_{\mathrm{i}}, \mathrm{~b}_{\mathrm{j}} \in \mathrm{Q} ; 1 \leq \mathrm{i}, \mathrm{j} \leq 2, \mathrm{~g}=(4,9)\right\} \subseteq \mathrm{P},
$$

$M_{1}$ is a special dual number like vector subspace of $P$ over $Q$.

## Consider

$$
\mathrm{M}_{3}=\left\{\left[\begin{array}{l}
0 \\
0 \\
0 \\
0 \\
0 \\
a_{1} \\
a_{2}
\end{array}\right]+\left[\begin{array}{c}
0 \\
0 \\
0 \\
0 \\
0 \\
b_{1} \\
b_{2}
\end{array}\right]|\mathrm{g}| \mathrm{a}_{\mathrm{i}}, \mathrm{~b}_{\mathrm{j}} \in \mathrm{Q} ; 1 \leq \mathrm{i}, \mathrm{j} \leq 2, \mathrm{~g}=(4,9)\right\} \subseteq \mathrm{P}
$$

is a special dual like number vector subspace of P .
Clearly $\mathrm{M}_{\mathrm{i}} \cap \mathrm{M}_{\mathrm{j}}=(0)$ if $\mathrm{i} \neq \mathrm{j}, 1 \leq \mathrm{i}, \mathrm{j} \leq 3$.
Further $V=M_{1}+M_{2}+M_{3}$, that $V$ is a direct sum of special dual like number vector subspaces of P over Q .

Let

$$
\begin{aligned}
& N_{1}=\left\{\begin{array}{c}
\left.\left[\begin{array}{c}
a_{1} \\
0 \\
a_{2} \\
0 \\
0 \\
\vdots \\
0
\end{array}\right]+\left[\begin{array}{c}
b_{1} \\
0 \\
b_{2} \\
0 \\
0 \\
\vdots \\
0
\end{array}\right] g \text { g } a_{i}, b_{j} \in Q ; 1 \leq i, j \leq 2, g=(4,9)\right\} \subseteq P, ~ \\
\hline
\end{array}\right. \\
& \mathrm{N}_{2}=\left\{\left.\left[\begin{array}{c}
\mathrm{a}_{1} \\
\mathrm{a}_{2} \\
0 \\
\vdots \\
0
\end{array}\right]+\left[\begin{array}{c}
b_{1} \\
b_{2} \\
0 \\
\vdots \\
0
\end{array}\right] \mathrm{g} \right\rvert\, \mathrm{a}_{\mathrm{i}}, \mathrm{~b}_{\mathrm{j}} \in \mathrm{Q} ; 1 \leq \mathrm{i}, \mathrm{j} \leq 2, \mathrm{~g}=(4,9)\right\} \subseteq \mathrm{P},
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{N}_{3}=\left\{\left[\begin{array}{c}
\left.\left.\left[\begin{array}{c}
a_{1} \\
0 \\
0 \\
a_{2} \\
0 \\
0 \\
0
\end{array}\right]+\left[\begin{array}{c}
b_{1} \\
0 \\
0 \\
b_{2} \\
0 \\
0 \\
0
\end{array}\right] g \right\rvert\, a_{i}, b_{j} \in Q ; g=(4,9) 1 \leq i, j \leq 2\right\} \subseteq P, ~
\end{array}\right.\right. \\
& \mathrm{N}_{4}=\left\{\left[\begin{array}{c}
a_{1} \\
0 \\
0 \\
0 \\
a_{2} \\
a_{3} \\
0
\end{array}\right]+\left[\begin{array}{c}
b_{1} \\
0 \\
0 \\
0 \\
b_{2} \\
b_{3} \\
0
\end{array}\right] g \text { ai, } b_{j} \in Q ; g=(4,9) 1 \leq i, j \leq 2\right\} \subseteq P \text { and } \\
& N_{5}=\left\{\left.\left[\begin{array}{c}
a_{1} \\
0 \\
0 \\
0 \\
a_{2} \\
0 \\
a_{3}
\end{array}\right]+\left[\begin{array}{c}
b_{1} \\
0 \\
0 \\
0 \\
b_{2} \\
0 \\
b_{3}
\end{array}\right] g \right\rvert\, a_{i}, b_{j} \in Q ; g=(4,9) 1 \leq i, j \leq 2\right\} \subseteq P
\end{aligned}
$$

be special dual like number vector subspaces of $P$.
Clearly $\mathrm{P}_{\mathrm{i}} \cap \mathrm{P}_{\mathrm{j}} \neq(0)$ if $\mathrm{i} \neq \mathrm{j}, 1 \leq \mathrm{i}, \mathrm{j} \leq 5$.

Further $\mathrm{P} \subseteq \mathrm{N}_{1}+\mathrm{N}_{2}+\mathrm{N}_{3}+\mathrm{N}_{4}+\mathrm{N}_{5}$. Thus P is a pseudo direct sum of subspaces of $P$ over $Q$.

Example 2.22: Let

$$
\begin{gathered}
V=\left\{\begin{array}{ccc}
{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right]+\left[\begin{array}{lll}
b_{1} & b_{2} & b_{3} \\
b_{4} & b_{5} & b_{6} \\
b_{7} & b_{8} & b_{9}
\end{array}\right](3,3,0,3,0) \right\rvert\, a_{i}, b_{j} \in Q,} \\
\left.1 \leq i, j \leq 9,3 \in Z_{6}\right\}
\end{array}, .\right.
\end{gathered}
$$

be a special dual like number vector space over the field Q . V has subspaces. If on V we define usual matrix product V becomes linear algebra of special dual like numbers which is non commutative.

If on V be define the natural product $\times_{\mathrm{n}}$, V becomes a commutative linear algebra of special dual like numbers.

## Example 2.23: Let

$$
\begin{aligned}
& \left.1 \leq \mathrm{i}, \mathrm{j} \leq 12, \mathrm{~g}=(9,4), 9,4 \in \mathrm{Z}_{12}\right\}
\end{aligned}
$$

be a vector space of special dual like numbers over the field Q . $S$ is a commutative linear algebra if on $S$ we define the natural product.

Now having seen examples of vector spaces and linear algebras of special dual like numbers we can find basis, linear operator, subspaces and linear functionals using them, which is treated as a matter of routine and hence left as an exercise to the reader.

Now we proceed onto define semiring of special dual like numbers and develop their related properties.

For properties of semirings, semifields and semivector spaces refer [19-20].

Let $S=\left\{a+b g \mid a, b \in R^{+} \cup\{0\}, g\right.$ is the new element, $\left.g^{2}=g\right\}$. It is easily verified S is a semiring which is a strict semiring. Infact $S$ is a semifield. The same result holds good if in $\mathrm{S}, \mathrm{R}^{+} \cup$ $\{0\}$ is replaced by $\mathrm{Z}^{+} \cup\{0\}$ and $\mathrm{Q}^{+} \cup\{0\}$.

We will illustrate this situation by some examples.
Example 2.24: Let $\mathrm{P}=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}^{+} \cup\{0\} \mathrm{g}=(4,9)\right.$ where $\left.4,9 \in Z_{12}, g^{2}=(4,9)^{2}=g\right\}$ be the semifield of special dual like numbers.

Example 2.25: Let

$$
\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{~b} \in \mathrm{Q}^{+} \cup\{0\}, \mathrm{g}=\left[\begin{array}{l}
3 \\
3 \\
3
\end{array}\right], 3 \in \mathrm{Z}_{6}\right\}
$$

be the semifield of special dual like numbers.
Example 2.26: Let

$$
M=\left\{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } x_{i}, y_{i} \in Z^{+} \cup\{0\}, 1 \leq i \leq 4,\right.
$$

g is the new element $(4,4)$ such that $\left.4 \in \mathrm{Z}_{12}\right\}$ be the semiring of special dual like numbers.

Clearly M is not a semifield for if

$$
x=\left[\begin{array}{c}
a_{1} \\
0 \\
0 \\
0
\end{array}\right] \text { and } y=\left[\begin{array}{c}
0 \\
b_{1} \\
0 \\
0
\end{array}\right] \text { are in } M \text { then } x x_{n} y=(0)
$$

So M is only a commutative strict semiring.
Example 2.27: Let

$$
S=\left\{\left.\left[\begin{array}{llll}
a_{1} & a_{2} & \ldots & a_{6} \\
a_{7} & a_{8} & \ldots & a_{12}
\end{array}\right]+\left[\begin{array}{cccc}
b_{1} & b_{2} & \ldots & b_{6} \\
b_{7} & b_{8} & \ldots & b_{12}
\end{array}\right] g \right\rvert\, 6=g \in Z_{30}\right.
$$

so that $\mathrm{g}^{2}=6 \times 6(\bmod 30)=6=\mathrm{g} . \mathrm{a}_{\mathrm{i}}, \mathrm{b}_{\mathrm{j}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{i}$, $\mathrm{j} \leq 12\}$ be the semiring of special dual like numbers under natural product $x_{n}$.
$S$ is not a semifield as $S$ has zero divisors.

## Example 2.28: Let

$$
\begin{array}{r}
P=\left\{\begin{array}{l}
{\left[\begin{array}{cc}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6} \\
a_{7} & a_{8} \\
a_{9} & a_{10}
\end{array}\right]+\left[\begin{array}{ll}
b_{1} & b_{2} \\
b_{3} & b_{4} \\
b_{5} & b_{6} \\
b_{7} & b_{8} \\
b_{9} & b_{10}
\end{array}\right]} \\
\left.1 \leq i, j \leq 10 ; g=10 \in Z_{30}\right\}
\end{array}, \begin{array}{l}
a_{i}, b_{j} \in Q^{+} \cup\{0\}, \\
1 \leq i
\end{array}\right]
\end{array}
$$

be the semiring of special dual like numbers. Clearly P is a strict semiring but P is not a semifield as P has zero divisors.

Example 2.29: Let

$$
\begin{aligned}
& S=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { with } g=(4,4,4,4,9,9) ;\right. \\
& \left.9,4 \in \mathrm{Z}_{12} ; 1 \leq \mathrm{i} \leq 9 ; \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}\right\}
\end{aligned}
$$

be the matrix semiring of special dual like numbers. S has zero divisors and S is a strict non commutative semiring under usual matrix product and a commutative semiring of matrices under the natural product.

Example 2.30: Let $\mathrm{M}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{6}\right)\right.$ where $\mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{g}$ with $\left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+}, 1 \leq \mathrm{i} \leq 6, \mathrm{~g}=4 \in \mathrm{Z}_{12}\right\} \cup\{(0,0,0,0,0,0)\}$ be a semiring of row matrices of special dual like numbers. M is also a semifield of dual like numbers.

Example 2.31: Now if we take

$$
\begin{aligned}
& P=\left\{\begin{array}{l}
{\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4} \\
a_{5}
\end{array}\right] \text { with } a_{i}=x_{i}+y_{i} g 1 \leq i \leq 5 ; ~}
\end{array}\right] \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}, \mathrm{g}=6 \in \mathrm{Z}_{30}\right\}
\end{aligned}
$$

be the semiring of column vectors under natural product $\times_{n}$ of special dual like numbers. Clearly P is only a strict semiring and is not a semifield.

Example 2.32: Let $\mathrm{W}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}=\mathrm{g}\right.$ with $\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in$ $\left.\mathrm{R}^{+}, 1 \leq \mathrm{i} \leq 3, \mathrm{~g}=9 \in \mathrm{Z}_{12}\right\} \cup\{(0,0,0)\}$ be a semifield of special dual like numbers.

## Example 2.33: Let

$$
\left.S=\left\{\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9} \\
a_{10} & a_{11} & a_{12} \\
a_{13} & a_{14} & a_{15}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { with } x_{i}, y_{i} \in R^{+},
$$

$$
1 \leq \mathrm{i} \leq 15\} \cup\left\{\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]\right\}
$$

be a semifield of special dual like numbers.

## Example 2.34: Let

$$
S=\left\{\left.\left[\begin{array}{ccc}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9} \\
a_{10} & a_{11} & a_{12} \\
a_{13} & a_{14} & a_{15}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { with } x_{i}, y_{i} \in Z^{+} \cup\{0\}\right.
$$

$$
\left.1 \leq \mathrm{i} \leq 15, \mathrm{~g}=6 \in \mathrm{Z}_{30}\right\}
$$

be a semiring of special dual like numbers. S is a strict semiring but is not a semifield S has non trivial zero divisors.

Example 2.35: Let

$$
\begin{aligned}
& P=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } g=3 \in Z_{6},\right. \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\} 1 \leq \mathrm{i}, \mathrm{j} \leq 9\right\}
\end{aligned}
$$

be the non commutative semiring of special dual like numbers. P is not a semifield as P contains zero divisors and P is non commutative.

## Example 2.36: Let

$$
\begin{aligned}
& M=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g, g=4 \in Z_{12},\right. \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{i}, \mathrm{j} \leq 9\right\}
\end{aligned}
$$

be the commutative semiring of special dual like numbers under the natural product $x_{n}$. $M$ is not a field for $M$ contains zero divisors.

Example 2.37: Let

$$
\begin{aligned}
& S=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g, g=4 \in Z_{12},\right. \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\} 1 \leq \mathrm{i} \leq 9\right\} \cup\left\{\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]\right\}
\end{aligned}
$$

be the non commutative semiring which has no zero divisors. Clearly S is not a semifield as the usual product on S is non commutative.

Example 2.38: Let

$$
\begin{gathered}
S=\left\{\left.\left[\begin{array}{ccc}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g, g=4 \in Z_{6}, x_{i}, y_{i} \in Q^{+},\right. \\
\left.1 \leq i \leq 9\} \cup\left\{\begin{array}{ccc}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]\right\} .
\end{gathered}
$$

$S$ under the natural product $x_{n}$ is a semifield.
Now having seen examples of semifields and semirings we wish to bring a relation between $S$ and $P$. Let

$$
S=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g, g=9 \in Z_{12}, x_{i}, y_{i} \in Q^{+}\right.
$$

$$
1 \leq \mathrm{i} \leq 9\} \cup\left\{\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]\right\} \text { and }
$$

$$
P=\left\{\left.\left[\begin{array}{lll}
x_{1} & x_{2} & x_{3} \\
x_{4} & x_{5} & x_{6} \\
x_{7} & x_{8} & x_{9}
\end{array}\right]+\left[\begin{array}{ccc}
y_{1} & y_{2} & y_{3} \\
y_{4} & y_{5} & y_{6} \\
y_{7} & y_{8} & y_{9}
\end{array}\right] g \right\rvert\, x_{i}, y_{i} \in Q^{+}\right.
$$

$$
\left.\mathrm{g}=9 \in \mathrm{Z}_{12}, 1 \leq \mathrm{i} \leq 9\right\} \cup\left\{\left[\begin{array}{ccc}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]+\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right] \mathrm{g}\right\}
$$

be two semifields under natural product, $\times_{n}$.
We can map $f: S \rightarrow P$ such that for any $A \in S$ in the following way.

$$
\begin{gathered}
f(A)=f\left(\left[\begin{array}{lll}
x_{1}+y_{1} g & x_{2}+y_{2} g & x_{3}+y_{3} g \\
x_{4}+y_{4} g & x_{5}+y_{5} g & x_{6}+y_{6} g \\
x_{7}+y_{7} g & x_{8}+y_{8} g & x_{9}+y_{6} g
\end{array}\right]\right) \\
=\left[\begin{array}{lll}
x_{1} & x_{2} & x_{3} \\
x_{4} & x_{5} & x_{6} \\
x_{7} & x_{8} & x_{9}
\end{array}\right]+\left[\begin{array}{lll}
y_{1} & y_{2} & y_{3} \\
y_{4} & y_{5} & y_{6} \\
y_{7} & y_{8} & y_{9}
\end{array}\right] g,
\end{gathered}
$$

f is a one to one map so the semifields are isomorphic, be it under natural product $\times_{n}$ or under usual product, $\times$.

Consider $\eta: \mathrm{P} \rightarrow \mathrm{S}$ such that

$$
\begin{array}{r}
\eta\left(\left[\begin{array}{lll}
x_{1} & x_{2} & x_{3} \\
x_{4} & x_{5} & x_{6} \\
x_{7} & x_{8} & x_{9}
\end{array}\right]+\left[\begin{array}{lll}
y_{1} & y_{2} & y_{3} \\
y_{4} & y_{5} & y_{6} \\
y_{7} & y_{8} & y_{9}
\end{array}\right] g\right. \\
\quad=\left[\begin{array}{lll}
x_{1}+y_{1} g & x_{2}+y_{2} g & x_{3}+y_{3} g \\
x_{4}+y_{4} g & x_{5}+y_{5} g & x_{6}+y_{6} g \\
x_{7}+y_{7} g & x_{8}+y_{8} g & x_{9}+y_{6} g
\end{array}\right]
\end{array}
$$

62 Special Dual like Numbers and Lattices

$$
=\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right]
$$

Clearly $\eta$ is a one to one map of P onto S . P is isomorphic to $S$ as semifield be it under the natural product $\times_{n}$ or be it under usual product.

Now we will show how addition and natural product / usual product are performed on square matrices with entries from special dual like numbers.

$$
\begin{aligned}
& \text { Let } \mathrm{A}=\left[\begin{array}{ll}
3+2 \mathrm{~g} & 6+\mathrm{g} \\
5-7 \mathrm{~g} & 1+3 \mathrm{~g}
\end{array}\right] \\
& \qquad=\left[\begin{array}{ll}
3 & 6 \\
5 & 1
\end{array}\right]+\left[\begin{array}{cc}
2 & 1 \\
-7 & 3
\end{array}\right] \mathrm{g} \text { and } \\
& \mathrm{B}=\left[\begin{array}{cc}
1+\mathrm{g} & 3-\mathrm{g} \\
4+3 \mathrm{~g} & 5+2 \mathrm{~g}
\end{array}\right]=\left[\begin{array}{cc}
1 & 3 \\
4 & 5
\end{array}\right]+\left[\begin{array}{cc}
1 & -1 \\
3 & 2
\end{array}\right] \mathrm{g} .
\end{aligned}
$$

$$
\text { Now } \mathrm{A} \times \mathrm{B}=\left[\begin{array}{cc}
3+2 \mathrm{~g} & 6+\mathrm{g} \\
5-7 \mathrm{~g} & 1+3 \mathrm{~g}
\end{array}\right] \times\left[\begin{array}{cc}
1+\mathrm{g} & 3-\mathrm{g} \\
4+3 \mathrm{~g} & 5+2 \mathrm{~g}
\end{array}\right]
$$

$$
=\left[\begin{array}{l}
(3+2 \mathrm{~g})(1+\mathrm{g})+(6+\mathrm{g})(4+3 \mathrm{~g}) \\
(5-7 \mathrm{~g})(1+\mathrm{g})+(1+3 \mathrm{~g})(4+3 \mathrm{~g})
\end{array}\right.
$$

$$
\left.\begin{array}{l}
(3+2 \mathrm{~g})(3-\mathrm{g})+(6+\mathrm{g})(5+2 \mathrm{~g}) \\
(5-7 \mathrm{~g})(3-\mathrm{g})+(1+3 \mathrm{~g})(5+2 \mathrm{~g})
\end{array}\right]
$$

$$
\begin{aligned}
& =\left[\begin{array}{c}
3+2 \mathrm{~g}+3 \mathrm{~g}+2 \mathrm{~g}+24+4 \mathrm{~g}+18 \mathrm{~g}+3 \mathrm{~g} \\
5+5 \mathrm{~g}-7 \mathrm{~g}-7 \mathrm{~g}+4+9 \mathrm{~g}+12 \mathrm{~g}+3 \mathrm{~g}
\end{array}\right. \\
& \left.\qquad \begin{array}{c}
9+6 \mathrm{~g}-3 \mathrm{~g}-2 \mathrm{~g}+30+12 \mathrm{~g}+5 \mathrm{~g}+2 \mathrm{~g} \\
15-21 \mathrm{~g}-5 \mathrm{~g}+7 \mathrm{~g}+5+15 \mathrm{~g}+6 \mathrm{~g}+2 \mathrm{~g}
\end{array}\right] \\
& =\left[\begin{array}{cc}
27+32 \mathrm{~g} & 39+20 \mathrm{~g} \\
9+15 \mathrm{~g} & 20+4 \mathrm{~g}
\end{array}\right] \\
& =\left[\begin{array}{cc}
27 & 39 \\
9 & 20
\end{array}\right]+\left[\begin{array}{cc}
32 & 20 \\
15 & 4
\end{array}\right] \mathrm{g} \quad \ldots \mathrm{I}
\end{aligned}
$$

Consider

$$
\begin{aligned}
& \left(\left[\begin{array}{ll}
3 & 6 \\
5 & 1
\end{array}\right]+\left[\begin{array}{cc}
2 & 1 \\
-7 & 3
\end{array}\right] \mathrm{g}\right)\left(\left[\begin{array}{cc}
1 & 3 \\
4 & 5
\end{array}\right]+\left[\begin{array}{cc}
1 & -1 \\
3 & 2
\end{array}\right] \mathrm{g}\right) \\
& \quad=\left[\begin{array}{ll}
3 & 6 \\
5 & 1
\end{array}\right]\left[\begin{array}{ll}
1 & 3 \\
4 & 5
\end{array}\right]+\left[\begin{array}{cc}
2 & 1 \\
-7 & 3
\end{array}\right]\left[\begin{array}{ll}
1 & 3 \\

\end{array}\right] g \quad \ldots \text { II } \\
& \text { I and II are equal. }
\end{aligned}
$$

Now if we consider

$$
\begin{array}{r}
P=\left\{\begin{array}{l}
{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4} \\
a_{5}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { with } x_{i}, y_{i} \in Z^{+},} \\
\left.g=3 \in Z_{6}, 1 \leq i \leq 5\right\} \cup\left\{\left[\begin{array}{l}
0 \\
0 \\
0 \\
0 \\
0
\end{array}\right]\right\}
\end{array}\right. \\
\end{array}
$$

be the semifield of special dual like numbers.

$$
\begin{array}{r}
S=\left\{\begin{array}{l}
{\left[\begin{array}{l}
x_{1} \\
x_{2} \\
x_{3} \\
x_{4} \\
x_{5}
\end{array}\right]+\left[\begin{array}{l}
y_{1} \\
y_{2} \\
y_{3} \\
y_{4} \\
y_{5}
\end{array}\right] g x_{i}, y_{i} \in Z^{+},} \\
\left.1 \leq i \leq 5, g=3 \in Z_{6}\right\} \cup\left\{\left[\begin{array}{l}
0 \\
0 \\
0 \\
0 \\
0
\end{array}\right]\right\}
\end{array}\right. \\
\end{array}
$$

be a the semifield of special dual like numbers.
We see S and P are isomorphic as semifields.

Similarly if

$$
\begin{gathered}
\left.S=\left\{\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{5} \\
a_{6} & a_{7} & \ldots & a_{10} \\
a_{11} & a_{12} & \ldots & a_{15}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g ; x_{i}, y_{i} \in Q^{+}, \\
\left.1 \leq i \leq 15, g=3 \in Z_{6}\right\} \cup\left\{\left[\begin{array}{cccc}
0 & 0 & \ldots & 0 \\
0 & 0 & \ldots & 0 \\
0 & 0 & \ldots & 0
\end{array}\right]\right\}
\end{gathered}
$$

be the semifield of special dual like numbers.
Let

$$
\begin{gathered}
\left.P=\left\{\begin{array}{cccc}
x_{1} & x_{2} & \ldots & x_{5} \\
x_{6} & x_{7} & \ldots & x_{10} \\
x_{11} & x_{12} & \ldots & x_{15}
\end{array}\right]+\left[\begin{array}{cccc}
y_{1} & y_{2} & \ldots & y_{5} \\
y_{6} & y_{7} & \ldots & y_{10} \\
y_{11} & y_{12} & \ldots & y_{15}
\end{array}\right] g \right\rvert\, \\
\left.x_{i}, y_{i} \in Q^{+}, 1 \leq i \leq 15, g=3 \in Z_{6}\right\} \\
\left.\cup\left\{\begin{array}{cccc}
0 & 0 & \ldots & 0 \\
0 & 0 & \ldots & 0 \\
\vdots & \vdots & & \vdots \\
0 & 0 & \ldots & 0
\end{array}\right]+\left[\begin{array}{cccc}
0 & 0 & \ldots & 0 \\
0 & 0 & \ldots & 0 \\
\vdots & \vdots & & \vdots \\
0 & 0 & \ldots & 0
\end{array}\right] g\right\}
\end{gathered}
$$

be the semifield of special dual like numbers. As semifields S and P are isomorphic.

Now using this fact either we represent elements as in S or as in P both are equivalent.

Now we can proceed on to define the notion of semiring of polynomial of dual numbers.

Let

$$
\begin{aligned}
& P=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{i}=t_{i}+s_{i} g \text { with } t_{i}, s_{i} \in Q^{+},\right. \\
&\left.g \text { such that } g^{2}=g\right\} \cup\{0\},
\end{aligned}
$$

S is a semifield of polynomials with special dual like numbers as its coefficients.

We can also have the coefficients to be matrices.

$$
\text { For consider } P=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \left\lvert\, a_{i}=\left[\begin{array}{c}
d_{i}^{1} \\
d_{i}^{2} \\
d_{i}^{3} \\
d_{i}^{4}
\end{array}\right]\right. \text { with } d_{i}^{t}=m_{i}^{t}+n_{i}^{t} g\right.
$$

where $\mathrm{g}^{2}=\mathrm{g}$ and $\left.\mathrm{m}_{\mathrm{i}}^{\mathrm{t}}, \mathrm{n}_{\mathrm{i}}^{\mathrm{t}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{t} \leq 4\right\} ; \mathrm{P}$ is only a semiring and is not a semifield as this special dual like number coefficient matrix polynomial ring has zero divisors.

$$
\text { Suppose } M=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \left\lvert\, a_{s}=\left[\begin{array}{l}
d_{i}^{1} \\
d_{i}^{2} \\
d_{i}^{3} \\
d_{i}^{4}
\end{array}\right]\right. \text { with } d_{i}^{t}=m_{i}^{t}+n_{i}^{t} g\right.
$$

where $\mathrm{g}^{2}=\mathrm{g}$ and $\left.\mathrm{m}_{\mathrm{i}}^{\mathrm{t}}, \mathrm{n}_{\mathrm{i}}^{\mathrm{t}} \in \mathrm{Z}^{+}, 1 \leq \mathrm{t} \leq 4\right\} \cup\{0\}$;
$M$ is a semifield with matrix polynomial special dual like number coefficients.

Thus we can have polynomials with matrix coefficients where the entries of the matrices are special dual like numbers.

We give examples of them.

Example 2.39: Let
$V=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \left\lvert\, a_{i}=\left[\begin{array}{cc}s_{1}^{i} & s_{5}^{i} \\ s_{2}^{i} & s_{6}^{i} \\ s_{3}^{i} & s_{7}^{i} \\ s_{4}^{i} & s_{8}^{i}\end{array}\right] s_{t}^{i}=x_{t}^{i}+y_{t}^{i} g\right.\right.$ with $x_{t}^{i}, y_{t}^{i} \in Z^{+}$,
g is the new element with $\mathrm{g}^{2}=\mathrm{g}$ and $\left.1 \leq \mathrm{t} \leq 8\right\} \cup\left\{\left[\begin{array}{ll}0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0\end{array}\right]\right\}$
be a semifield of special dual like number matrix coefficients.

Example 2.40: Let

$$
\mathrm{V}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \left\lvert\, \mathrm{a}_{\mathrm{i}}=\left[\begin{array}{cc}
\mathrm{p}_{1}^{\mathrm{i}} & \mathrm{p}_{5}^{\mathrm{i}} \\
\mathrm{p}_{2}^{\mathrm{i}} & \mathrm{p}_{6}^{\mathrm{i}} \\
\mathrm{p}_{3}^{\mathrm{i}} & \mathrm{p}_{7}^{\mathrm{i}} \\
\mathrm{p}_{4}^{\mathrm{i}} & \mathrm{p}_{8}^{\mathrm{i}}
\end{array}\right]\right. \text { where } \mathrm{p}_{\mathrm{i}}=\mathrm{x}_{\mathrm{t}}^{\mathrm{i}}+\mathrm{y}_{\mathrm{t}}^{\mathrm{i}} \mathrm{~g}\right.
$$

$$
\text { with } \mathrm{x}_{\mathrm{t}}^{\mathrm{i}}, \mathrm{y}_{\mathrm{t}}^{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}
$$

and g is the new element such that $\left.\mathrm{g}^{2}=\mathrm{g} ; 1 \leq \mathrm{i} \leq 8\right\}$ be the semiring of special dual like number polynomials with matrix coefficients. Clearly $M$ is not a semifield.

Example 2.41: Let

$$
\begin{array}{r}
\mathrm{P}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{k}}=\left(\mathrm{m}_{\mathrm{ij}}\right)_{6 \times 6}, \mathrm{~m}_{\mathrm{ij}}=\mathrm{t}_{\mathrm{ij}}+\mathrm{s}_{\mathrm{ij}} \mathrm{~g} \text { with } \mathrm{t}_{\mathrm{ij}}, \mathrm{~s}_{\mathrm{ij}} \in \mathrm{R}^{+},\right. \\
\left.1 \leq \mathrm{i}, \mathrm{j} \leq 36, \mathrm{~g}=3 \text { is in } \mathrm{Z}_{6} \text { with } \mathrm{g}^{2}=\mathrm{g}=3\right\} \cup
\end{array}
$$

$$
\left\{\left[\begin{array}{llllll}
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0
\end{array}\right]\right\}
$$

be the semifield of special dual like number with square matrix coefficient polynomials under the natural product $x_{n}$. If the usual product ' $x$ ' of matrices is taken $P$ is only a semiring as the operation ' $x$ ' on $P$ is non commutative.

Also if in $\mathrm{P}, \mathrm{t}_{\mathrm{ij}}, \mathrm{s}_{\mathrm{ij}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i}, \mathrm{j} \leq 36, \mathrm{~g}=3 \in \mathrm{Z}_{6}$ then also $P$ is only a semiring even under natural product $x_{n}$ as $P$ has zero divisors.

Thus we have seen examples of various types of semirings and semifields of special dual like numbers.

Now we describe how we get special dual like numbers. In the first place the modulo integers happen to be a very rich structure that can produce the new element ' g ' with $\mathrm{g}^{2}=\mathrm{g}$, which is used to construct special dual like numbers.

For take any $Z_{n}$, $n$ not a prime and $n \geq 6$ then in most cases we get atleast one new element $g \in Z_{n}$ such that $g^{2}=g(\bmod n)$.

We just give illustrations.
Consider $\mathrm{Z}_{6}, 3,4 \in \mathrm{Z}_{6}$ are such that $3^{2} \equiv 3(\bmod 6)$ and $4^{2}=$ $4(\bmod 6) 3$ and 6 are new elements. Consider $Z_{7}, Z_{11}$ or any $Z_{p}$ they do not have new elements such that they are idempotents.

In view of this we see if $x \in Z_{n}$ is an idempotent then $x^{2}=x$ so that $\mathrm{x}^{2}-\mathrm{x}=0$ that is $\mathrm{x}^{2}+(\mathrm{n}-1) \mathrm{x}=0$.

$$
\text { Hence } \mathrm{x}(\mathrm{x}+\mathrm{n}-1)=0 \text { as } \mathrm{x} \neq 0 \text { and } \mathrm{x}+\mathrm{n}-1 \not \equiv 0 \text {. }
$$

We see $3^{2}=3(\bmod 6) 3^{2}-3 \equiv 0(\bmod 6)$ that is $3^{2}+5 \times 3$ $\equiv 0(\bmod 6)$ that is $3[3+5] \equiv 0(\bmod 6) 3 \times 2 \equiv 0(\bmod 6)$. So $\mathrm{Z}_{6}$ has zero divisors.
$4 \in \mathrm{Z}_{6}$ is such that $4^{2} \equiv 4(\bmod 6) 4 \times(4+5) \equiv 0(\bmod 6)$ so that $4 \times 3 \equiv 0(\bmod 6)$ is a zero divisor. We have 3 and 4 in $\mathrm{Z}_{6}$ are idempotents. These serve to build special dual like numbers.

Not only we get $\mathrm{a}+\mathrm{bg}$ and $\mathrm{c}+\mathrm{dg}_{1}, \mathrm{~g}=3$ and $\mathrm{g}_{1}=4$ are special dual like numbers but elements like

$$
\mathrm{p}=\left[\begin{array}{l}
3 \\
4 \\
0 \\
3
\end{array}\right] \text { and } \mathrm{q}=\left[\begin{array}{ll}
3 & 4 \\
4 & 3 \\
4 & 4 \\
3 & 3 \\
3 & 0 \\
0 & 3 \\
4 & 0
\end{array}\right]
$$

are also such that $\mathrm{p} \times \mathrm{p}=\mathrm{p}(\bmod 6)$ and $\mathrm{q} \times \mathrm{n}=\mathrm{q}(\bmod 6)$.

$$
\text { If } A=\left[\begin{array}{llll}
3 & 4 & 0 & 3 \\
4 & 4 & 0 & 4 \\
3 & 4 & 0 & 4
\end{array}\right] \text { we see } A \times_{n} A \equiv A(\bmod 6) \text { and so }
$$

on.
Thus this method leads us to get from these two new elements 3 and 4 infinitely many new elements or to be more in mathematical terminology we see we can using these two idempotents with 0 construct infinitely many $\mathrm{m} \times \mathrm{n}$ matrices $\mathrm{m}, \mathrm{n} \in \mathrm{Z}^{+}$which are idempotents.

Thus using these collection of idempotents we can build special dual like numbers.

Clearly $\mathrm{Z}_{8}$ has no idempotents, $\mathrm{Z}_{9}$ has no idempotents, however $\mathrm{Z}_{10}$ has idempotents $5,6 \in \mathrm{Z}_{10}$ are idempotents. $\mathrm{Z}_{11}$ has no idempotent. Consider $Z_{12}, Z_{12}$ has 4 and 9 to be idempotents. $\mathrm{Z}_{14}$ has 7 and 8 to be idempotents. In $\mathrm{Z}_{15}, 6$ and 10 are idempotents. $Z_{18}$ has 9 and 10 to be their idempotents.

In view of this we have the following three theorems.
THEOREM 2.11: Let $Z_{p}$ be the finite prime field of characteristic $p . Z_{p}$ has no idempotents.

Proof: Clear from the fact a field cannot have idempotents.
THEOREM 2.12 : Let $Z_{p^{2}}$ be the finite modulo integers, $p a$ prime $Z_{p^{2}}$ has no idempotents.

Simple number theoretic methods yields the result for if $\mathrm{n} \in \mathrm{Z}_{\mathrm{p}^{2}}$ is such that $\mathrm{n}^{2}=\mathrm{n}\left(\bmod \mathrm{p}^{2}\right)$ then $\mathrm{n}(\mathrm{n}-1) \equiv 0\left(\bmod \mathrm{p}^{2}\right)$.

Using the fact p is a prime $\mathrm{n}^{2} \equiv \mathrm{n}$ is impossible by simple number theoretic techniques.

However this is true for any $\mathrm{Z}_{\mathrm{p}^{n}} \mathrm{p}$ a prime, $\mathrm{n} \geq 2$.

Example 2.42: Let $\mathrm{Z}_{27}$ be the ring of modulo integers. $\mathrm{Z}_{27}$ has no idempotents $\mathrm{Z}_{27}=\mathrm{Z}_{3^{3}}$.

Example 2.43: Let $\mathrm{S}=\mathrm{Z}_{10}$ be the ring 5, $6 \in \mathrm{Z}_{10}$ are such that $5^{2}=25=5(\bmod 10), 6^{2}=36=6(\bmod 10)$.

So 5, 6 are idempotents of $Z_{10}$.
Example 2.44: Let $\mathrm{S}=\mathrm{Z}_{14}$ be the ring of modulo integers 7, 8 $\in Z_{14}$ are such that $7^{2}=49=7(\bmod 14), 8^{2}=64 \equiv 8(\bmod 14)$, 8 and 7 are the only idempotents of $Z_{14}$.

Example 2.45: Let $\mathrm{S}=\mathrm{Z}_{34}$ be the ring of modulo integers. 17, $18 \in \mathrm{Z}_{34}$ are such that $17^{2} \equiv 17(\bmod 34)$ and $18^{2}=8(\bmod 34)$. Thus only 17 and 18 are the idempotents of $Z_{34}$ which is used in the construction of special dual like numbers.

Inview all these examples we have the following theorem.
THEOREM 2.13: Let $S=Z_{2 p}$ (where $p$ is a prime) be the ring of modulo integers. Clearly $p, p+1$ are idempotents of $S$.

Proof is direct using simple number theoretic techniques.
Example 2.46: Let $\mathrm{Z}_{15}$ be the ring of modulo integers 6 and 10 are idempotents of $Z_{15}$.

Example 2.47: Let $\mathrm{Z}_{21}$ be the ring of modulo integers. 7 and 15 are the idempotents of $\mathrm{Z}_{21}$.

Example 2.48: Let $\mathrm{Z}_{33}$ be the ring of modulo integers. 12 and 22 are idempotents of $Z_{33}$.

Example 2.49: Let $\mathrm{Z}_{39}$ be the ring of modulo integers. 13 and 27 are idempotents of $Z_{39}$.

Example 2.50: Let $\mathrm{Z}_{35}$ be the ring of integers the idempotents in $Z_{35}$ are 15 and 21.

Inview of all these we make the following theorem.
THEOREM 2.14: Let $Z_{p q}$ ( $p$ and $q$ two distinct primes) be the ring of modulo integers $Z_{p q}$ has two idempotent $t$ and $m$ such that $t=a p$ and $q=b m, a \geq 1$ and $m \geq 1$.

The proof is straight forward and uses only simple number theoretic methods.

Example 2.51: Let $Z_{30}$ be the ring of integers. 6, 10, 15, 16, 21 and 25 are idempotents of $\mathrm{Z}_{30}$.

Example 2.52: Let $\mathrm{Z}_{42}$ be the ring of integers. 7, 15, 21, 22, 28 and 36 are idempotents of $\mathrm{Z}_{42}$.

Thus we have the following theorem.
THEOREM 2.15: Let $Z_{n}$ be the ring of integers. $n=p q r$ where $p, q$ and $r$ are three distinct primes.

Then $Z_{n}$ has atleast 6 non trivial idemponents which are of the form $\mathrm{ap}, \mathrm{bq}$ and $\mathrm{cr}(\mathrm{a} \geq 1, \mathrm{~b} \geq 1$ and $\mathrm{c} \geq 1)$.

The proof exploits simple number theoretic techniques.
Example 2.53: Let $\mathrm{Z}_{210}$ be the ring of modulo integers. 15, 21, $36,60,70,105,106,196,175,120,126$, and 85 are some of the idempotents in $\mathrm{Z}_{210}$.

Example 2.54: Let $\mathrm{Z}_{50}$ be the ring of modulo integers. 25 and 26 are the only idempotent of $Z_{50}$.

Now using these idempotents we can construct many special dual like numbers.

Next we proceed on to study the algebraic structures enjoyed by the collection of idempotents in $Z_{n}$.

Example 2.55: Let $\mathrm{Z}_{42}$ be the ring of modulo integers. We see $S=\{7,0,15,21,22,28$ and 36$\}$ are idempotents of $Z_{42}$ we give the table under $\times$. However under ' + ' we see $S$ is not even closed.

| $\times$ | 0 | 7 | 15 | 21 | 22 | 28 | 36 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 7 | 0 | 7 | 21 | 21 | 28 | 28 | 0 |
| 15 | 0 | 21 | 15 | 21 | 36 | 0 | 36 |
| 21 | 0 | 21 | 21 | 21 | 0 | 0 | 0 |
| 22 | 0 | 28 | 36 | 0 | 22 | 28 | 36 |
| 28 | 0 | 28 | 0 | 0 | 28 | 28 | 0 |
| 36 | 0 | 0 | 36 | 0 | 36 | 0 | 36 |

$(\mathrm{S}, \times$ ) is a semigroup. Thus product of any two distinct idempotents in S is either an idempotent or a zero divisor.

$$
\begin{aligned}
& \text { That is for } a, b \in S \text {. } \\
& \text { We have } a \times b=0(\bmod 42) \\
& \text { or }(a \times b)=c(\bmod 42), 0 \neq c \in S \\
& \text { or } a \times b=b(\bmod 42) \\
& \text { or } a \times b=a(\bmod 42) \text {. }
\end{aligned}
$$

We call this semigroup as special dual like number associated component semigroup of S.

Example 2.56: Let $\mathrm{Z}_{30}$ be the ring of modulo integers.
$S=\{0,6,10,15,16,21,25\} \subseteq Z_{30}$ be the collection of idempotents of $Z_{30}$. Clearly $S$ is not closed under ' + ' modulo 30.

The table for S under $\times$ is as follows:

| $\times$ | 0 | 6 | 10 | 15 | 16 | 21 | 25 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 6 | 0 | 6 | 0 | 0 | 6 | 6 | 0 |
| 10 | 0 | 0 | 10 | 0 | 10 | 0 | 10 |
| 15 | 0 | 0 | 0 | 15 | 0 | 15 | 15 |
| 16 | 0 | 6 | 10 | 0 | 16 | 6 | 10 |
| 21 | 0 | 6 | 0 | 15 | 6 | 21 | 15 |
| 25 | 0 | 10 | 10 | 15 | 21 | 15 | 25 |

$(\mathrm{S}, \mathrm{x})$ is a semigroup which is the special dual like number associated semigroup. If we want we can adjoin ' 1 '. The unit element as $1^{2}=1(\bmod n)$. Now we cannot give any other structure. Further S is not an idempotent semigroup also.

We can call it as an idempotent semigroup provided we accept ' 0 ' as the idempotent and $\mathrm{xy}=0(\mathrm{x} \neq 0$ and $\mathrm{y} \neq 0)$ then interpret ' $x y=0$ ' as not zero divisor but again an idempotent.

THEOREM 2.16: Let $Z_{m}$ be the ring of modulo integers. $m=2 p$ where $p$ is a prime. $S=\{0, p, p+1\} \subseteq Z_{m}$ is a semigroup with $p(p+1)=0(\bmod m)$.

Proof : $\mathrm{p}(\mathrm{p}+1)=\mathrm{p}^{2}+\mathrm{p}=\mathrm{p}(\mathrm{p}+1)$ as $\mathrm{p}+1$ is even as p is a prime. So $\mathrm{p}(\mathrm{p}+1) \equiv 0(\bmod \mathrm{~m})$. Hence the claim. $(\mathrm{S}, \times)$ is a semigroup.

We see in case of $Z_{33}, 22$ and 12 are the idempotents of $Z_{33}$. We see $22 \times 12 \equiv 0(\bmod 33)$. Further $S=\{0,12,22\} \subseteq \mathrm{Z}_{33}$ is a semigroup.

Thus we see as in case of $Z_{2 p}$ the ring $Z_{3 p}, p$ a prime also behaves. Infact for $Z_{35}, 15$ and 21 are idempotents and $15 \times 21 \equiv 0(\bmod 35)$.

Hence $\mathrm{S}=\{0,15,21\} \subseteq \mathrm{Z}_{35}$ is a semigroup under product $\times$.

In view of all these we have the following theorem.
THEOREM 2.17: Let $Z_{p q}$ ( $p$ and $q$ be two distinct primes) be the ring of modulo integers. Let $x, y$ be idempotents of $Z_{p q}$ we see $x \times y \equiv 0(\bmod p q)$ and $S=\{0, x, y\} \subseteq Z_{p q}$ is a semigroup.

The proof requires only simple number theoretic techniques hence left as an exercise to the reader.

Let $\mathrm{S}=\mathrm{Z}_{\mathrm{m}}$ where $\mathrm{m}=\mathrm{p}_{1} \mathrm{p}_{2} \ldots \mathrm{p}_{\mathrm{t}}, \mathrm{p}_{\mathrm{i}}$ are distinct that m is the product of $t$ distinct primes.
(i) How many idempotents does $\mathrm{Z}_{\mathrm{m}} \backslash\{0,1\}$ contain?
(ii) Is $\mathrm{P}=\left\{\mathrm{s}_{1}, \ldots, \mathrm{~s}_{\mathrm{n}}, 0,1\right\}$, a semigroup where $\mathrm{s}_{1}, \ldots, \mathrm{~s}_{\mathrm{n}}$ are idempotents of $\mathrm{Z}_{\mathrm{m}}$ ?

This is left as an open problem for the reader.
Now we proceed on to describe semivector spaces and semilinear algebras of special dual like numbers.

Let $M=\left\{\left(a_{1}, a_{2}, \ldots, a_{9}\right) \mid a_{i}=x_{i}+y_{i} g\right.$ where $x_{i}, y_{i} \in Z^{+} \cup$ $\{0\}$, g such that $\left.\mathrm{g}^{2}=\mathrm{g} ; 1 \leq \mathrm{i} \leq 9\right\}$ be a semivector space of special dual like numbers over the semifield.

M is also known as the special dual like number semivector space over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

Clearly M is not a semivector space over the semifields $\mathrm{Q}^{+} \cup\{0\}$ or $\mathrm{R}^{+} \cup\{0\}$.

## Example 2.57: Let

$$
\begin{aligned}
& V=\left\{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4} \\
a_{5}
\end{array}\right] \right\rvert\, a_{i} \in\left\{x_{i}+y_{i} g \mid x_{i}, y_{i} \in Q^{+} \cup\{0\},\right.\right. \\
& \left.\left.\mathrm{g}=3 \in \mathrm{Z}_{6}, \mathrm{~g}^{2}=\mathrm{g} 1 \leq \mathrm{i} \leq 5\right\}\right\}
\end{aligned}
$$

be the semivector space of special dual like numbers over the semifield $\mathrm{Q}^{+} \cup\{0\}$ or $\mathrm{Z}^{+} \cup\{0\}$. If on V we can define $\times_{\mathrm{n}}$ the natural product, V becomes a semilinear algebra.

## Example 2.58: Let

$$
\begin{array}{r}
S=\left\{\left.\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4}
\end{array}\right] \right\rvert\, a_{i}=\left\{x_{i}+y_{i} g \text { where } x_{i}, y_{i} \in Q^{+} \cup\{0\},\right.\right. \\
\left.\left.g=7 \in Z_{14}, 1 \leq i \leq 4\right\}\right\}
\end{array}
$$

be the semivector space over the semifield $\mathrm{Z}^{+} \cup\{0\}$.
If we define the usual matrix product $\times$ on $S$ then $S$ is a non commutative semilinear algebra.

If on $S$ we define the natural product $x_{n}$ then $S$ is a commutative semilinear algebra special dual like numbers over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

$$
\begin{aligned}
& \text { Let } \mathrm{A}=\left[\begin{array}{ll}
3+2 \mathrm{~g} & 0 \\
4+5 \mathrm{~g} & 2+\mathrm{g}
\end{array}\right] \text { and } \mathrm{B}=\left[\begin{array}{cc}
0 & 1+3 \mathrm{~g} \\
2+\mathrm{g} & 4+2 \mathrm{~g}
\end{array}\right] \text { be in } \mathrm{S} . \\
& \mathrm{A} \times \mathrm{B}=\left[\begin{array}{cc}
3+2 \mathrm{~g} & 0 \\
4+5 \mathrm{~g} & 2+\mathrm{g}
\end{array}\right] \times\left[\begin{array}{cc}
0 & 1+3 \mathrm{~g} \\
2+\mathrm{g} & 4+2 \mathrm{~g}
\end{array}\right] \\
&=\left[\begin{array}{cc}
0 & (3+2 \mathrm{~g})(1+3 \mathrm{~g}) \\
(2+\mathrm{g})^{2} & (4+5 \mathrm{~g})(1+3 \mathrm{~g})+(2+\mathrm{g})(4+2 \mathrm{~g})
\end{array}\right] \\
&=\left[\begin{array}{cc}
0 & 3+2 \mathrm{~g}+9 \mathrm{~g}+6 \mathrm{~g}^{2} \\
4+4 \mathrm{~g}+\mathrm{g}^{2} & 4+12 \mathrm{~g}+5 \mathrm{~g}+15 \mathrm{~g}^{2}+8+4 \mathrm{~g}+4 \mathrm{~g}+2 \mathrm{~g}^{2}
\end{array}\right] \\
&=\left[\begin{array}{cc}
0 & 3+17 \mathrm{~g} \\
4+5 \mathrm{~g} & 12+42 \mathrm{~g}
\end{array}\right] \in \mathrm{S} .
\end{aligned}
$$

Suppose instead of the usual product $\times$ we define the natural product $\times_{n}$;

$$
\begin{aligned}
A \times_{n} B & =\left[\begin{array}{cc}
3+2 g & 0 \\
4+5 g & 2+g
\end{array}\right] \times n\left[\begin{array}{cc}
0 & 1+3 g \\
2+g & 4+2 g
\end{array}\right] \\
& =\left[\begin{array}{cc}
0 & 0 \\
8+10 g+4 g+5 g^{2} & 8+4 g+4 g+2 g^{2}
\end{array}\right] \\
& =\left[\begin{array}{cc}
0 & 0 \\
8+19 \mathrm{~g} & 8+10 \mathrm{~g}
\end{array}\right] \in \mathrm{S} .
\end{aligned}
$$

However we see $\mathrm{A} \times \mathrm{B} \neq \mathrm{A} \times_{\mathrm{n}} \mathrm{B}$.

## Example 2.59: Let

$$
\begin{aligned}
& P=\left\{\left.\begin{array}{l}
{\left.\left[\begin{array}{cc}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6} \\
a_{7} & a_{8} \\
a_{9} & a_{10}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g}
\end{array} \right\rvert\,\right. \\
&\left.\quad \text { where } g=5 \in Z_{10}, x_{i}, y_{i} \in R^{+} \cup\{0\}, 1 \leq i \leq 10\right\}
\end{aligned}
$$

be a semivector space of special dual like number over the semifield $Z^{+} \cup\{0\}$.

On P we can define the usual product, however under the natural product $\times_{\mathrm{n}}, \mathrm{P}$ is a semilinear algebra.

Consider

$$
\mathrm{M}_{2}=\left\{\left.\left[\begin{array}{cc}
0 & 0 \\
a_{1} & a_{2} \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } g=5 \in Z_{10}\right.
$$

$$
\left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 2\right\} \subseteq \mathrm{P}
$$

$$
\begin{aligned}
& M_{1}=\left\{\left[\left.\begin{array}{cc}
{\left[\begin{array}{cc}
a_{1} & a_{2} \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right]}
\end{array} \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } g=5 \in Z_{10},\right.\right. \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 2\right\} \subseteq \mathrm{P},
\end{aligned}
$$

$$
\begin{aligned}
& M_{3}=\left\{\left.\left[\begin{array}{cc}
0 & 0 \\
0 & 0 \\
a_{1} & a_{2} \\
0 & 0 \\
0 & 0
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } g=5 \in Z_{10},\right. \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 2\right\} \subseteq \mathrm{P}, \\
& M_{4}=\left\{\left.\left[\begin{array}{cc}
0 & 0 \\
0 & 0 \\
0 & 0 \\
a_{1} & a_{2} \\
0 & 0
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } g=5 \in Z_{10},\right. \\
& \left.\mathrm{X}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 2\right\} \subseteq \mathrm{P} \text { and } \\
& M_{5}=\left\{\left.\left[\begin{array}{cc}
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
a_{1} & a_{2}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } g=5 \in Z_{10},\right. \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 2\right\} \subseteq \mathrm{P}
\end{aligned}
$$

be semivector subspaces of the semivector space $P$. Infact $M_{1}$, $M_{2}, M_{3}, M_{4}$ and $M_{5}$ are semivector subspaces of special dual like numbers over the semifield $\mathrm{Z}^{+} \cup\{0\}$ of P .

80 | Special Dual like Numbers and Lattices

$$
\text { Clearly } \mathrm{M}_{\mathrm{i}} \cap \mathrm{M}_{\mathrm{j}}=\left[\begin{array}{ll}
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right] \text { if } \mathrm{i} \neq \mathrm{j}, 1 \leq \mathrm{i}, \mathrm{j} \leq 5 \text { and }
$$

$P=M_{1}+M_{2}+M_{3}+M_{4}+M_{5}$, that is $P$ is the direct sum of special dual like number semivector subspaces of P over the semifield $\mathrm{R}^{+} \cup\{0\}$.

Suppose

$$
\mathrm{T}_{1}=\left\{\begin{array}{rl}
{\left[\begin{array}{cc}
\mathrm{a}_{1} & a_{2} \\
a_{3} & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right]}
\end{array} \left\lvert\, \begin{array}{l}
\mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{~g} \text { where } \mathrm{g}=5 \in \mathrm{Z}_{10}, \\
\left.x_{i}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 3\right\} \subseteq \mathrm{P}
\end{array}\right.\right.
$$

$$
\mathrm{T}_{2}=\left\{\left.\left[\begin{array}{cc}
0 & 0 \\
\mathrm{a}_{1} & a_{2} \\
a_{3} & 0 \\
0 & 0 \\
0 & 0
\end{array}\right]\right|_{a_{i}=x_{i}+y_{i} g \text { where } g=5 \in Z_{10},}\right.
$$

$$
\left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 3\right\} \subseteq \mathrm{P}
$$

$$
\mathrm{T}_{3}=\left\{\begin{array}{cc}
{\left.\left[\begin{array}{cc}
0 & 0 \\
a_{1} & 0 \\
0 & a_{2} \\
a_{3} & 0 \\
0 & 0
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } g=5 \in Z_{10},} \\
\end{array}\right.
$$

$$
\left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 3\right\} \subseteq \mathrm{P}
$$

$$
T_{4}=\left\{\begin{array}{rl}
{\left[\begin{array}{cc}
0 & 0 \\
a_{1} & 0 \\
0 & 0 \\
0 & a_{2} \\
a_{3} & 0
\end{array}\right]}
\end{array} \left\lvert\, \begin{array}{l}
a_{i}=x_{i}+y_{i} g \text { where } g=5 \in Z_{10}, \\
\left.x_{i}, y_{i} \in R^{+} \cup\{0\}, 1 \leq i \leq 3\right\} \subseteq P
\end{array}\right.\right.
$$

and

$$
T_{5}= \begin{cases}{\left.\left[\begin{array}{cc}
0 & 0 \\
a_{1} & 0 \\
0 & 0 \\
0 & a_{2} \\
a_{3} & 0
\end{array}\right] \right\rvert\,} & x_{i}=x_{i}+y_{i} g \text { where } g=5 \in Z_{10}, \\
\left.x_{i}, y_{i} \in R^{+} \cup\{0\}, 1 \leq i \leq 3\right\} \subseteq P\end{cases}
$$

be special dual like number semivector subspaces of P over the semifield $\mathrm{R}^{+} \cup\{0\}$.

$$
\begin{gathered}
\text { We see } T_{i} \cap T_{j}= \begin{cases}{\left[\begin{array}{ll}
0 & 0 \\
a & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right]} & \text { if } i \neq j, 1 \leq i, j \leq 5, a=x+y g\end{cases} \\
\left.g \in Z_{10}, x, y \in R^{+} \cup\{0\}\right\}
\end{gathered}
$$

Only in one case

$$
\begin{aligned}
& T_{4} \cap T_{5}=\left\{\begin{array}{cc}
{\left.\left[\begin{array}{cc}
0 & 0 \\
a_{1} & 0 \\
0 & 0 \\
0 & 0 \\
a_{2} & 0
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g, g=5 \in Z_{10},} \\
\end{array}\right. \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 2\right\} \subseteq \mathrm{P} .
\end{aligned}
$$

Thus $\mathrm{P} \underset{\neq}{\subset} \mathrm{T}_{1}+\mathrm{T}_{2}+\mathrm{T}_{3}+\mathrm{T}_{4}+\mathrm{T}_{5}$, so P is the pseudo direct sum of special dual like number semivector subspaces of P over the semifield $\mathrm{R}^{+} \cup\{0\}$.

We have several semivector subspaces of $P$. $P$ can be represented as a direct sum or as a pseudo direct sum depending on the subsemivector spaces taken under at that time.

Example 2.60: Let

$$
V=\left\{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4} \\
a_{5}
\end{array}\right] \right\rvert\, a_{i} \in\left\{x_{i}+y_{i} g \mid x_{i}, y_{i} \in Q^{+} \cup\{0\}\right\},\right.
$$

$$
\left.1 \leq \mathrm{i} \leq 5, \mathrm{~g}=10 \in \mathrm{Z}_{30}\right\}
$$

be a semivector space of special dual like numbers over the semifield $\mathrm{Q}^{+} \cup\{0\}$.

$$
\mathrm{W}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \mathrm{a}_{4}, \mathrm{a}_{5}\right) \mid \mathrm{a}_{\mathrm{i}}=\left\{\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{~g} \mid \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}\right\}, 1\right.
$$

$\left.\leq \mathrm{i} \leq 5, \mathrm{~g}=6 \in \mathrm{Z}_{30}\right\}$ be a semivector space of special dual like numbers over the semifield $\mathrm{Q}^{+} \cup\{0\}$.

Consider T : V $\rightarrow$ W

$$
\mathrm{T}\left(\left[\begin{array}{l}
\mathrm{a}_{1} \\
\mathrm{a}_{2} \\
\mathrm{a}_{3} \\
\mathrm{a}_{4} \\
\mathrm{a}_{5}
\end{array}\right]\right)=\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \mathrm{a}_{4}, \mathrm{a}_{5}\right)
$$

then T is defined as a semilinear transformation from V to W .
Likewise we can define the notion of semilinear operator and semilinear functional of a semivector space of special dual like numbers.

For if $\mathrm{A}=(3+2 \mathrm{~g}, 4+\mathrm{g}, 15+\mathrm{g}, 2 \mathrm{~g}, 0) \in \mathrm{V}$ then if f is a semilinear functional from V to $\mathrm{Q}^{+} \cup\{0\}$, we see

$$
\mathrm{f}(\mathrm{~A})=3+4+15+0+0=22 \in \mathrm{Q}^{+} \cup\{0\} .
$$

So we can define f as a semilinear functional of V .
Thus the study of semilinear functional, semilinear operator and semilinear transformation can be treated as a matter of routine. This task of defining / describing the related properties of these structures and finding $\operatorname{Hom}_{\mathrm{Q}^{+} \cup\{0\}}(\mathrm{V}, \mathrm{W})$, $\operatorname{Hom}_{\mathrm{Q}^{+} \cup\{0\}}(\mathrm{V}, \mathrm{V})$ and $\mathrm{L}\left(\mathrm{V}, \mathrm{Q}^{+} \cup\{0\}\right)$ are left as exercise to the reader.

We can also define projection and semiprojection on vector spaces and semivector spaces of special dual numbers respectively.

Further both projections as well semiprojections themselves can be used to construct special dual like numbers.

One can do all the study by replacing the semivector space of special dual like numbers by the semilinear algebra of special
dual like numbers over the semifield. This study is also simple and hence left for the reader as exercise.

Finally we can define the notion of basis, linearly dependent set and linearly independent set of a semivector space / semilinear algebra of special dual like numbers.

We can also define the notion of set vector space of special dual like numbers and semigroup vector space of special dual like numbers over the field F . We have two or more dual numbers and they are not related in any way we use the concept of set vector space of special dual like numbers.

All these concepts we only describe by examples.
Example 2.61: Let $\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg}_{1}, \mathrm{c}+\mathrm{dg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathrm{R}, \mathrm{g}_{1}=5\right.$ $\in \mathrm{Z}_{10}$ and $\left.\mathrm{g}_{2}=3 \in \mathrm{Z}_{6}\right\}$ be a set vector space of special dual like numbers over the set $S=3 Z$.

Example 2.62: Let

$$
\begin{aligned}
& T=\left\{\begin{array}{l}
{\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4}
\end{array}\right],\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4}
\end{array}\right],\left(a_{1}, a_{2}, a_{3}, a_{4}\right) \mid a_{i}=\left\{x_{i}+y_{i} g \text { with }\right\}}
\end{array}\right. \\
& \left.\left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}\right\}, 1 \leq \mathrm{i} \leq 4, \mathrm{~g}=(3,4,3,4,3,4) \text { where } 3,4 \in \mathrm{Z}_{6}\right\}
\end{aligned}
$$

be a set vector space of special dual like numbers over the set $S=\{3 Z \cup 5 Z \cup 7 Z\}$.

Example 2.63: Let

$$
\mathrm{T}=\left\{\left[\begin{array}{ll}
\mathrm{a}_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6}
\end{array}\right],\left[\begin{array}{ccccc}
a_{1} & a_{2} & a_{3} & \ldots & a_{10} \\
a_{11} & a_{12} & a_{13} & \ldots & a_{20}
\end{array}\right],\left(a_{1}, a_{2}, a_{3}\right) \mid\right.
$$

$$
\begin{aligned}
& \mathrm{a}_{\mathrm{i}}=\left\{\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{~g} \text { with } \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}\right\}, 1 \leq \mathrm{i} \leq 20 \\
& \left.\quad \mathrm{~g}=(10,10,0,10,0) \text { where } 10 \in \mathrm{Z}_{30}\right\}
\end{aligned}
$$

be a set vector space of special dual like numbers over the set $\mathrm{F}=5 \mathrm{Z}$.

## Example 2.64: Let

$$
\begin{aligned}
& W=\left\{\sum_{i=0}^{\infty} a_{i} x^{i}, \sum_{i=0}^{\infty} b_{i} x^{i} \mid a_{i}=\left\{x_{i}+y_{i} g_{1}\right. \text { with }\right. \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}, \mathrm{~g}_{1}=5 \in \mathrm{Z}_{10}\right\} \text {, and } \mathrm{b}_{\mathrm{j}}=\mathrm{x}_{\mathrm{j}}+\mathrm{y}_{\mathrm{j}} \mathrm{~g}_{2} \text {, } \\
& \left.\mathrm{g}_{2}=10 \in \mathrm{Z}_{30}, \mathrm{x}_{\mathrm{j}}, \mathrm{y}_{\mathrm{j}} \in 3 \mathrm{Z}\right\}
\end{aligned}
$$

be the set vector space of special dual like numbers over the set $S=5 Z \cup 3 Z^{+}$.

It is pertinent to mention here that we can define subset vector subspaces of special dual like numbers and set vector subspaces of special dual like numbers.

## Example 2.65: Let

$$
\begin{gathered}
\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg}_{1}, \mathrm{~d}+\mathrm{cdg}_{2}, \mathrm{e}+\mathrm{fg}_{3} \mid \mathrm{a}, \mathrm{~b} \in 3 \mathrm{Z}, \mathrm{c}, \mathrm{~d} \in 5 \mathrm{Z}\right. \\
\\
\text { and e,f } \mathrm{f} \in 11 \mathrm{Z}^{+} \cup\{0\} \text { where } \mathrm{g}_{1}=4 \in \mathrm{Z}_{11}, \\
\left.\mathrm{~g}_{2}=\left[\begin{array}{l}
3 \\
0 \\
3 \\
4
\end{array}\right], 3,4 \in \mathrm{Z}_{6} \text { and } \mathrm{g}_{3}=(6,10,6,10), 6,10 \in \mathrm{Z}_{30}\right\}
\end{gathered}
$$

be the set vector space of special dual like numbers over the set S $=5 \mathrm{Z}$.

## Example 2.66: Let

$$
\begin{aligned}
& S=\left\{\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4}
\end{array}\right], c+d g_{2}, \sum_{i=0}^{\infty} d_{i} x^{i} \mid a_{i}=\left\{x_{i}+y_{i} g_{1}\right. \text { with }\right. \\
& \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in 13 \mathrm{Z}, 1 \leq \mathrm{i} \leq 4, \mathrm{~g}_{1}=6 \in \mathrm{Z}_{30}, \mathrm{c}, \mathrm{~d} \in \mathrm{Q}, \\
& \mathrm{~g}_{2}=\left[\begin{array}{l}
4 \\
3 \\
4 \\
3
\end{array}\right], 4,3 \in \mathrm{Z}_{6}, \mathrm{~d}_{\mathrm{i}}=\mathrm{m}_{\mathrm{i}}+\mathrm{n}_{\mathrm{i}} \mathrm{~g}_{3} \text { where } \\
& \left.\left.\mathrm{g}_{3}=(5,5,5,6,0,5,6), 5,6 \in \mathrm{Z}_{10}, \mathrm{~m}_{\mathrm{i}}, \mathrm{n}_{\mathrm{i}} \in 12 \mathrm{Z}\right\}\right\}
\end{aligned}
$$

be a set vector space of special dual like numbers over the set $5 Z^{+} \cup 3 \mathrm{Z}$.

## Example 2.67: Let

$$
\begin{aligned}
S= & \left\{a+b g_{1}, d+\operatorname{cdg}_{2} \text { and } e+f_{3} \mid a, b \in Z^{+}, c, d \in Q^{+}\right. \text {and } \\
& e, f \in 14 Z^{+}, \text {where } g_{1}=(0,4,9,0,4,9), 4,9 \in Z_{12}, \\
g_{2}= & {\left.\left[\begin{array}{l}
3 \\
4 \\
3 \\
4 \\
3
\end{array}\right], 3,4 \in Z_{6} \text { and } g_{3}=\left[\begin{array}{cc}
10 & 6 \\
6 & 10
\end{array}\right] \text { where } 10,6 \in Z_{30}\right\} }
\end{aligned}
$$

be the set vector space of special dual like numbers over the set $\mathrm{S}=5 \mathrm{Z}^{+} \cup 8 \mathrm{Z}^{+}$.

All properties associated with set vector spaces can be developed in case of set vector spaces of special dual like number without any difficulty. This task is left as an exercise to the interested reader.

Now we proceed onto define a very special set vector spaces which we choose to call as strong special set like vector spaces of special dual like numbers.

DEFINITION 2.1: Let $S=$ \{collection of algebraic structures using special dual like numbers\} be a set. Let $F$ be a field if for every $x \in S$ and $a \in F$
(i) $a x=x a \in S$.
(ii) $(a+b) x=a x+b x$
(iii) $a(x+y)=a x+a y$
(iv) $a .0=0$
(v) $1 . s=s$ for all $x, y, s \in S$ and $a, b, 0 \in F$, then we define $S$ to be a strong special set like vector space of special dual like numbers.

We will illustrate this situation by some examples.
Example 2.68: Let

$$
M=\left\{\left[\begin{array}{l}
{\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4}
\end{array}\right],\left[\begin{array}{ccc}
x_{1} & x_{5} & x_{9} \\
x_{2} & x_{6} & x_{10} \\
x_{3} & x_{7} & x_{11} \\
x_{4} & x_{8} & x_{12}
\end{array}\right],\left(d_{1}, d_{2}, \ldots, d_{10}\right) \mid a_{i}=m_{i}+n_{i} g_{1}, ~}
\end{array}\right.\right.
$$

$\mathrm{d}_{\mathrm{j}}=\mathrm{t}_{\mathrm{j}}+\mathrm{s}_{\mathrm{j}} \mathrm{g}_{3}$ and $\mathrm{x}_{\mathrm{k}}=\mathrm{p}_{\mathrm{k}}+\mathrm{r}_{\mathrm{k}} \mathrm{g}_{2}$ where $\mathrm{m}_{\mathrm{i}}, \mathrm{n}_{\mathrm{i}} \in \mathrm{Q}, 1 \leq \mathrm{i} \leq 4, \mathrm{p}_{\mathrm{k}}$, $\mathrm{r}_{\mathrm{k}} \in \mathrm{R}, 1 \leq \mathrm{k} \leq 12$ and $\mathrm{t}_{\mathrm{j}}, \mathrm{s}_{\mathrm{j}} \in \mathrm{Q} ; 1 \leq \mathrm{j} \leq 10$; with $\mathrm{g}_{1}=(4,3,4), 4,3 \in \mathrm{Z}_{6}, \mathrm{~g}_{2}=(17,18), 17,18 \in \mathrm{Z}_{34}$ and

$$
\left.\mathrm{g}_{3}=\left(\begin{array}{llll}
7 & 8 & 7 & 8 \\
7 & 0 & 8 & 7
\end{array}\right), 7,8 \in \mathrm{Z}_{14}\right\}
$$

be the strong special set like vector space of special dual like numbers over the field Q . Clearly no addition can be performed on M.

Example 2.69: Let

$$
\begin{aligned}
& \mathrm{S}=\left\{\mathrm{a}+\mathrm{bg}_{1}, \mathrm{c}+\mathrm{dg}_{2}, \mathrm{c}+\mathrm{fg}_{3}, \mathrm{~m}+\mathrm{ng}_{4}, \mathrm{x}+\mathrm{yg}_{5} \mid \mathrm{a}, \mathrm{~b}, \mathrm{e}, \mathrm{f} \in \mathrm{R}, \mathrm{c},\right. \\
& \mathrm{d}, \mathrm{~m}, \mathrm{n}, \mathrm{x}, \mathrm{y} \in \mathrm{Q}, \mathrm{~g}_{1}=\left[\begin{array}{l}
4 \\
3 \\
4 \\
3
\end{array}\right], 4,3 \in \mathrm{Z}_{6}, \\
& \mathrm{~g}_{2}=\left(\begin{array}{lll}
7 & 8 & 7 \\
8 & 7 & 8 \\
8 & 8 & 8
\end{array}\right), 8,7 \in \mathrm{Z}_{14}, \mathrm{~g}_{3}=\left(\begin{array}{cccc}
10 & 6 & 10 & 6 \\
6 & 10 & 6 & 10
\end{array}\right), 10,6 \in \mathrm{Z}_{30}, \\
& \mathrm{~g}_{4}=\left[\begin{array}{ll}
5 & 6 \\
6 & 5 \\
5 & 5 \\
6 & 6
\end{array}\right], 5,6 \in \mathrm{Z}_{10} \text { and } \\
& \left.\mathrm{g}_{5}=\left[\begin{array}{llllll}
4 & 9 & 4 & 9 & 4 & 9 \\
9 & 4 & 9 & 4 & 9 & 4
\end{array}\right] \text { with } 9,4 \in \mathrm{Z}_{12}\right\}
\end{aligned}
$$

be a strong special set like vector space of special dual like numbers over the field $Q$. We see $g_{1}, g_{2}, g_{3}, g_{4}$ and $g_{5}$ are idempotents which are unrelated for they take values from distinct $\mathrm{Z}_{\mathrm{n}}$ 's. No type of compatability can be achieved as it is not possible to define operations on them.

## Example 2.70: Let

$$
M=\left\{\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3}
\end{array}\right],\left(x_{1}, x_{2}, x_{3}\right), m+n g_{3}, \sum_{i=0}^{\infty} t_{i} x^{i} \mid a_{i}=r_{i}+s_{i} g_{1},\right.
$$

$\mathrm{x}_{\mathrm{j}}=\mathrm{c}_{\mathrm{j}}+\mathrm{d}_{\mathrm{j}} \mathrm{g}_{2}, \mathrm{t}_{\mathrm{k}}=\mathrm{q}_{\mathrm{k}}+\mathrm{p}_{\mathrm{k}} \mathrm{g}_{4}$ such that $\mathrm{r}_{\mathrm{i}}, \mathrm{s}_{\mathrm{i}}, \mathrm{c}_{\mathrm{j}}, \mathrm{d}_{\mathrm{j}}, \mathrm{q}_{\mathrm{k}}, \mathrm{p}_{\mathrm{k}}$,
m and $\mathrm{n} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 3,1 \leq \mathrm{j} \leq 3,1 \leq \mathrm{k} \leq \infty ; \mathrm{g}_{1}=(6,10,6)$,

$$
\mathrm{g}_{2}=\left[\begin{array}{c}
10 \\
6 \\
10
\end{array}\right], \mathrm{g}_{3}=\left[\begin{array}{cccc}
6 & 10 & 6 & 10 \\
6 & 10 & 6 & 10 \\
6 & 6 & 10 & 10
\end{array}\right] \text { and } \mathrm{g}_{4}=(10,6)
$$

with $\left.10,6 \in \mathrm{Z}_{30}\right\}$
be a strong special set vector space of special dual like numbers over the field Q .

Though the $\mathrm{g}_{\mathrm{i}}$ 's are elements basically from $\mathrm{Z}_{30}$ that using the idempotents 6 and 10 of $Z_{30}$, still we see we cannot define any sort of compatible operation on M .

Now on same lines we can define strong special set like semivector space of special dual like numbers over the semifield F.

We only give some examples for this concept.

## Example 2.71: Let

$$
\begin{gathered}
\mathrm{P}=\left\{\mathrm{a}+\mathrm{bg}_{1}, \mathrm{c}+\mathrm{dg}_{2}, \mathrm{~m}+\mathrm{nd}_{3} \text { where } \mathrm{a}, \mathrm{~b} \in \mathrm{Q}^{+} \cup\{0\},\right. \\
\mathrm{c}, \mathrm{~d} \in 3 \mathrm{Z}^{+} \cup\{0\} \text { and } \mathrm{m}, \mathrm{n} \in \mathrm{R}^{+} \cup\{0\} ; \\
\mathrm{g}_{1}=(3,4), 3,4 \in \mathrm{Z}_{6}, \mathrm{~g}_{2}=\left[\begin{array}{llllllll}
3 & 4 & 3 & 4 & 3 & 4 & 3 & 4 \\
4 & 3 & 4 & 3 & 4 & 3 & 4 & 3
\end{array}\right] \\
\left.4,3 \in \mathrm{Z}_{6} \text { and } \mathrm{g}_{3}=\left[\begin{array}{llll}
4 & 3 & 4 \\
3 & 4 & 4 \\
4 & 4 & 3 \\
3 & 4 & 3
\end{array}\right], 4,3 \in \mathrm{Z}_{6}\right\}
\end{gathered}
$$

be the strong special set like semivector space of special dual like numbers over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

Clearly no compatible operation on P can be defined. Further P is not a semivector space over $\mathrm{Q}^{+} \cup\{0\}$ or $\mathrm{R}^{+} \cup\{0\}$.

## Example 2.72: Let

$$
S=\left\{\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6}
\end{array}\right],\left(d_{1}, d_{2}, d_{3}, d_{4}, d_{5}\right),\left[\begin{array}{ll}
x_{1} & x_{2} \\
x_{3} & x_{4}
\end{array}\right],\left[\begin{array}{l}
p_{1} \\
p_{2} \\
p_{3}
\end{array}\right]\right. \text { where }
$$

$\mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{g}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in 3 \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 6, \mathrm{~d}_{\mathrm{j}}=\mathrm{m}_{\mathrm{j}}+\mathrm{n}_{\mathrm{j}} \mathrm{g} ; \mathrm{m}_{\mathrm{j}}, \mathrm{n}_{\mathrm{j}} \in$ $5 \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{j} \leq 5, \mathrm{x}_{\mathrm{t}}=\mathrm{r}_{\mathrm{t}}+\mathrm{s}_{\mathrm{t}} \mathrm{g} ; 1 \leq \mathrm{t} \leq 4, \mathrm{r}_{\mathrm{t}}, \mathrm{s}_{\mathrm{t}} \in 17 \mathrm{Z}^{+} \cup\{0\}$ and $\mathrm{p}_{\mathrm{s}}=\mathrm{q}_{\mathrm{s}}+\mathrm{t}_{\mathrm{s}} \mathrm{q}, \mathrm{q}_{\mathrm{s}}, \mathrm{t}_{\mathrm{s}} \in 43 \mathrm{Z}^{+} \cup\{0\} ; 1 \leq \mathrm{s} \leq 3$ with $\left.\mathrm{g}=4 \in \mathrm{Z}_{12}\right\}$ be a strong special set like semivector space of special dual like numbers over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

## Example 2.73: Let

$$
W=\left\{\sum_{i=0}^{\infty} a_{i} x^{i}, \sum_{i=0}^{\infty} b_{i} x^{i}, \sum_{i=0}^{\infty} m_{i} x^{i} \mid a_{i}=t_{i}+s_{i} g_{1}+n_{j}=m_{j}+n_{j} g_{2}\right.
$$

and $\mathrm{m}_{\mathrm{k}}=\mathrm{c}_{\mathrm{k}}+\mathrm{d}_{\mathrm{k}} \mathrm{g}_{3}$ where $\mathrm{t}_{\mathrm{i}}, \mathrm{s}_{\mathrm{i}} \in 3 \mathrm{Z}^{+} \cup\{0\}, \mathrm{m}_{\mathrm{j}}, \mathrm{n}_{\mathrm{j}} \in 47 \mathrm{Z}^{+} \cup\{0\}$

$$
\begin{aligned}
& \text { and } c_{k}, d_{k} \in 10 \mathrm{Z}^{+} \cup\{0\} \text { with } \mathrm{g}_{1}=\left[\begin{array}{ll}
3 & 4 \\
4 & 3 \\
3 & 4 \\
4 & 3 \\
3 & 4
\end{array}\right] ; 4,3 \in \mathrm{Z}_{6}, \\
& \mathrm{~g}_{2}=(10,6,10,6,10,6), 10,6 \in \mathrm{Z}_{30} \text { and }
\end{aligned}
$$

$$
\left.\mathrm{g}_{3}=\left[\begin{array}{lllll}
11 & 12 & 11 & 12 & 11 \\
12 & 11 & 12 & 11 & 12 \\
11 & 11 & 12 & 12 & 12
\end{array}\right] ; 11,12 \in \mathrm{Z}_{22}\right\}
$$

be the strong special set like semivector space of special dual like numbers over the semifield $Z^{+} \cup\{0\}$.

## Example 2.74: Let

$S=\left\{\left[\begin{array}{ll}a_{1} & a_{5} \\ a_{2} & a_{6} \\ a_{3} & a_{7} \\ a_{4} & a_{8}\end{array}\right],\left(\begin{array}{lll}d_{1} & d_{2} & d_{3} \\ d_{4} & d_{5} & d_{6} \\ d_{7} & d_{8} & d_{9}\end{array}\right),\left[\begin{array}{ll}b_{1} & b_{2} \\ b_{3} & b_{4}\end{array}\right], x+y g \mid x, y \in Q^{+} \cup\{0\}\right.$,
$\mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{g}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 8, \mathrm{~b}_{\mathrm{j}}=\mathrm{t}_{\mathrm{j}}+\mathrm{s}_{\mathrm{j}} \mathrm{g} ; \mathrm{t}_{\mathrm{j}}, \mathrm{s}_{\mathrm{j}} \in \mathrm{Q}^{+}$ $\cup\{0\}, \mathrm{d}_{\mathrm{m}}=\mathrm{a}_{\mathrm{m}}+\mathrm{b}_{\mathrm{m}} \mathrm{g}, \mathrm{a}_{\mathrm{m}}, \mathrm{b}_{\mathrm{m}} \in \mathrm{Q}^{+} \cup\{0\} ; 1 \leq \mathrm{m} \leq 9,1 \leq \mathrm{j} \leq 4$ and $\left.g=10 \in Z_{30}\right\}$ be the strong special set like semivector space of special dual like numbers over the semifield $\mathrm{Q}^{+} \cup\{0\}$.

## Example 2.75: Let

$$
\begin{aligned}
& S=\left\{\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4}
\end{array}\right],\left[\begin{array}{ll}
b_{1} & b_{2} \\
b_{3} & b_{4}
\end{array}\right],\left[\begin{array}{ll}
c_{1} & c_{2} \\
c_{3} & c_{4}
\end{array}\right], \left.\left[\begin{array}{ll}
d_{1} & d_{2} \\
d_{3} & d_{4}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g, b_{j}\right. \\
& =m_{j}+n_{j} g_{2}, c_{k}=s_{k}+r_{k} g_{3} \text { and } d_{m}=a_{m}+b_{m} g_{4} \text { where } x_{i}, x_{j}, y_{i}, n_{j}, \\
& \mathrm{~s}_{\mathrm{k}}, \mathrm{r}_{\mathrm{k}}, a_{\mathrm{m}} \text { and } \mathrm{b}_{\mathrm{m}} \in \in \mathrm{Q}^{+} \cup\{0\}, 1 \leq \mathrm{i}, \mathrm{j}, \mathrm{k}, \mathrm{~m} \leq 4 .
\end{aligned}
$$

$$
\begin{gathered}
\mathrm{g}_{1}=\left(\begin{array}{ll}
4 & 3
\end{array} 43\right) ; 4,3 \in \mathrm{Z}_{6}, \mathrm{~g}_{2}=\left[\begin{array}{cc}
10 & 6 \\
10 & 6 \\
6 & 10
\end{array}\right], 10,6 \in \mathrm{Z}_{30}, \\
\mathrm{~g}_{3}=\left[\begin{array}{lllll}
11 & 12 & 11 & 12 & 11 \\
12 & 11 & 12 & 11 & 12
\end{array}\right] ; 11,12 \in \mathrm{Z}_{22} \text { and }
\end{gathered}
$$

$$
\left.g_{4}=\left[\begin{array}{cccccc}
6 & 10 & 6 & 10 & 6 & 10 \\
10 & 6 & 10 & 6 & 10 & 6
\end{array}\right], 10,6 \in \mathrm{Z}_{30}\right\}
$$

be the strong special set like semivector space of special dual like numbers over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

The study of substructures, writing them as direct sum of subspaces, expressing them as a direct sum of pseudo vector subspaces, linear transformation, linear operator and linear functionals happen to be a matter of routine, hence left as an exercise to the reader.

## Example 2.76: Let

$$
S=\left\{\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6} \\
a_{7} & a_{8}
\end{array}\right],\left[\begin{array}{ccc}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right],\left(a_{1}, a_{2}, \ldots, a_{12}\right) \mid a_{i} \in\left\{x_{i}+y_{i} g\right.\right.
$$

$$
\text { where } \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\} \text { and } \mathrm{g}=\left[\begin{array}{llll}
3 & 4 & 3 & 4 \\
4 & 3 & 4 & 3
\end{array}\right] \text { with }
$$

$$
\left.\left.3,4 \in \mathrm{Z}_{12}\right\} ; 1 \leq \mathrm{i} \leq 12\right\}
$$

be the strong special set like semivector space of special dual like numbers over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

$$
\text { Take } M_{1}=\left\{\left.\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6} \\
a_{7} & a_{8}
\end{array}\right] \right\rvert\, a_{i} \in\left\{x_{i}+y_{i} g\right.\right.
$$

$$
\text { where } \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\} 1 \leq \mathrm{i} \leq 8\right\} \subseteq \mathrm{S} \text {, }
$$

$$
\begin{gathered}
M_{2}=\left\{\left.\left[\begin{array}{ccc}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i} \in\left\{x_{i}+y_{i} g \text { where } x_{i}, y_{i} \in Q^{+} \cup\{0\}\right.\right. \\
\left.g=\left[\begin{array}{cccc}
3 & 4 & 3 & 4 \\
4 & 3 & 4 & 3
\end{array}\right], 1 \leq i \leq 9\right\} \subseteq S
\end{gathered}
$$

and

$$
\mathrm{M}_{3}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{12}\right) \mid \mathrm{a}_{\mathrm{i}} \in\left\{\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{~g}\right.\right.
$$

where $\left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}, \mathrm{g}=\left[\begin{array}{cccc}3 & 4 & 3 & 4 \\ 4 & 3 & 4 & 3\end{array}\right], 1 \leq \mathrm{i} \leq 12\right\} \subseteq \mathrm{S}$
are strong special set like semivector subspaces of special dual like numbers of $S$ over the semifield $Z^{+} \cup\{0\}$.

Clearly $S=M_{1}+M_{2}+M_{3}$ and $M_{i} \cap M_{j}=\phi$ if $i \neq j ; 1 \leq i, j \leq$ 3. Thus S is the direct sum of semivector subspaces.

Now consider

$$
P_{1}=\left\{\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6} \\
a_{7} & a_{8}
\end{array}\right],\left(a_{1}, a_{2}, \ldots, a_{12}\right) \mid a_{i}=x_{i}+y_{i} g\right.
$$

where $\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\} ; 1 \leq \mathrm{i} \leq 12$,

$$
\left.\mathrm{g}=\left[\begin{array}{cccc}
3 & 4 & 3 & 4 \\
4 & 3 & 4 & 3
\end{array}\right], 3,4 \in \mathrm{Z}_{12}\right\} \subseteq \mathrm{S}
$$

$$
\begin{aligned}
& P_{2}=\left\{\left(a_{1}, a_{2}, \ldots, a_{12}\right), \left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right. \\
& \text { with } \mathrm{X}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\} ; 1 \leq \mathrm{i} \leq 12 \text {, } \\
& \left.\mathrm{g}=\left[\begin{array}{llll}
3 & 4 & 3 & 4 \\
4 & 3 & 4 & 3
\end{array}\right], 3,4 \in \mathrm{Z}_{12}\right\} \subseteq \mathrm{S} \text { and } \\
& P_{3}=\left\{\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right], \left.\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6} \\
a_{7} & a_{8}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right. \\
& \text { with } \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 9, \mathrm{~g}=\left[\begin{array}{llll}
3 & 4 & 3 & 4 \\
4 & 3 & 4 & 3
\end{array}\right] \text {, } \\
& \left.3,4 \in \mathrm{Z}_{12}\right\} \subseteq \mathrm{S}
\end{aligned}
$$

be strong special set like semivector subspaces of special dual like numbers over the semifield $Z^{+} \cup\{0\}$.

Clearly $\mathrm{P}_{\mathrm{i}} \cap \mathrm{P}_{\mathrm{j}} \neq \phi$ if $\mathrm{i} \neq \mathrm{j} ; 1 \leq \mathrm{i}, \mathrm{j} \leq 3$.

Thus $\mathrm{S} \supseteq \mathrm{P}_{1}+\mathrm{P}_{2}+\mathrm{P}_{3}$ so S is only a pseudo direct sum of semivector subspaces of $S$ over $Z^{+} \cup\{0\}$.

We can define $\mathrm{T}: \mathrm{S} \rightarrow \mathrm{S}$
where $\mathrm{T}\left(\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4} \\ a_{5} & a_{6} \\ a_{7} & a_{8}\end{array}\right]\right)=\left[\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9}\end{array}\right]$,

$$
T\left(a_{1}, a_{2}, a_{3}, a_{4}, a_{5}, a_{6}, \ldots, a_{12}\right)=\left[\begin{array}{ccc}
a_{2} & a_{4} & a_{6} \\
a_{8} & a_{10} & a_{12} \\
a_{3} & a_{6} & a_{9}
\end{array}\right]
$$

and

$$
T\left(\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right]\right)=\left(a_{1}, a_{2}, a_{3}, a_{4}, a_{5}, a_{6}, a_{7}, a_{8}, a_{9}, a_{10}, a_{11}, a_{12}\right)
$$

Thus T is a special set linear operator on S .
Similarly we can define
$\mathrm{f}: \mathrm{S} \rightarrow \mathrm{Z}^{+} \cup\{0\}$ as follows:

$$
f\left(\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6} \\
a_{7} & a_{8}
\end{array}\right]\right)=\left[x_{1}+x_{2}+x_{3}+x_{4}+x_{5}+x_{6}+x_{7}+x_{8}\right]
$$

where $a_{i}=x_{i}+y_{i} g ; x_{i}, y_{i} \in Q^{+} \cup\{0\}$ that is if $\sum x_{i}=n$ if $n$ is a fraction we near it to a integer.

For instance $\mathrm{n}=\mathrm{t} / \mathrm{s} \mathrm{t}$, s but $\mathrm{t} / \mathrm{s}>1 / 2=0.5$ then $\mathrm{n}=1 \mathrm{if} \mathrm{t} / \mathrm{s}<$ $1 / 2=0.5$ then $\mathrm{n}=0$ if $\mathrm{t} / \mathrm{s}=\mathrm{m} \mathrm{r} / \mathrm{s}$ with $\mathrm{r} / \mathrm{s}<0.5$ then $\mathrm{t} / \mathrm{s}=\mathrm{m}$ if $\mathrm{t} / \mathrm{s}=\mathrm{m}+\mathrm{r} / \mathrm{s} \quad \mathrm{r} / \mathrm{s}>0.5 \mathrm{t} / \mathrm{s}=\mathrm{m}+1$.
f is a set linear functional on S .
Interested reader can study the properties of basis, linear independent element and linearly dependent elements and so on.

Now we just show we can write a matrix with entries $a_{i}=x_{i}+y_{i} g$ in the form of two matrices that is A $+B g$ where A and $B$ are matrices with $g^{2}=g$, we can define this as the special dual like matrix number.

We will illustrate this situation only by examples.

## Example 2.77: Let

$\mathrm{M}=\left\{\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}, \mathrm{x}_{4}\right)+\left(\mathrm{y}_{1}, \mathrm{y}_{2}, \mathrm{y}_{3}, \mathrm{y}_{4}\right) \mathrm{g} \mid \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}, \mathrm{g}^{2}=\mathrm{g}\right\}$ be a special dual like row matrix number semiring.

We see $\mathrm{N}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \mathrm{a}_{4}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{g}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{j}} \in \mathrm{Q}^{+} \cup\{0\}\right.$, $\left.1 \leq i, j \leq 4, g^{2}=g\right\}$ is a special dual like row matrix number semiring such that M is isomorphic to N , by an isomorphism
$\eta: M \rightarrow N$ such that

$$
\begin{aligned}
& \eta\left(\left(x_{1}, x_{2}, x_{3}, x_{4}\right)+\left(y_{1}, y_{2}, y_{3}, y_{4}\right) g\right) \\
& \quad=\left(x_{1}+y_{1} g, x_{2}+g_{2} g, x_{3}+y_{3} g, x_{4}+y_{4} g\right)=\left(a_{1}, a_{2}, a_{3}, a_{4}\right) .
\end{aligned}
$$

Example 2.78: Let

$$
\mathrm{T}=\left\{\begin{array}{c}
\mathrm{x}_{1} \\
\mathrm{x}_{2} \\
\vdots \\
\mathrm{x}_{10}
\end{array}\right],\left[\begin{array}{c}
\mathrm{y}_{1} \\
\mathrm{y}_{2} \\
\vdots \\
\mathrm{y}_{10}
\end{array}\right] \mathrm{g} \mathrm{~g}=\left[\begin{array}{ccccc}
3 & 4 & 3 & 4 & 3 \\
4 & 3 & 4 & 3 & 4
\end{array}\right]
$$

$$
\text { with } \left.3,4 \in \mathrm{Z}_{6}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 10\right\}
$$

be the special dual like column matrix number semiring such that T is isomorphic with

$$
\begin{aligned}
& P=\left\{\left.\left[\begin{array}{c}
a_{1} \\
a_{2} \\
\vdots \\
a_{10}
\end{array}\right] \right\rvert\, a_{i}=x_{i}, y_{i} g+1 \leq i \leq 10\right. \text { and } \\
& \left.\mathrm{g}=\left[\begin{array}{lllll}
3 & 4 & 3 & 4 & 3 \\
4 & 3 & 4 & 3 & 4
\end{array}\right], 3,4 \in \mathrm{Z}_{6} \text { with } \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}\right\} .
\end{aligned}
$$

Example 2.79: Let

$$
\begin{aligned}
S=\{ & \left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right. \text { with } \\
& \left.g=\left[\begin{array}{l}
4 \\
3 \\
4
\end{array}\right], 4,3 \in Z_{6}, x_{i}, y_{i} \in Z^{+} \cup\{0\}, 1 \leq i \leq 9\right\}
\end{aligned}
$$

be the special dual like square matrix number semiring such that S is isomorphic with

$$
\begin{aligned}
& P=\left\{\left.\left[\begin{array}{lll}
x_{1} & x_{2} & x_{3} \\
x_{4} & x_{5} & x_{6} \\
x_{7} & x_{8} & x_{9}
\end{array}\right]+\left[\begin{array}{lll}
y_{1} & y_{2} & y_{3} \\
y_{4} & y_{5} & y_{6} \\
y_{7} & y_{8} & y_{9}
\end{array}\right] g \right\rvert\, g=\left[\begin{array}{l}
4 \\
3 \\
4
\end{array}\right],\right. \\
& \left.4,3 \in \mathrm{Z}_{6}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{i}, \mathrm{j} \leq 9\right\}
\end{aligned}
$$

the special dual like square matrix number semiring.
Finally consider the following example.
Example 2.80: Let

$$
\begin{array}{r}
P=\left\{\begin{aligned}
{ \left.\left[\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{10} \\
a_{11} & a_{12} & \ldots & a_{20} \\
a_{21} & a_{22} & \ldots & a_{30}
\end{array}\right] \right\rvert\, x_{i}, y_{i} g ; g=\left[\begin{array}{cccc}
7 & 8 & 7 & 8 \\
\hline 8 & 7 & 8 & 7
\end{array}\right] } \\
\hline
\end{aligned}\right], \\
\left.7,8 \in Z_{14} ; x_{i}, y_{i} \in Z^{+} \cup\{0\}, 1 \leq i \leq 30\right\}
\end{array}
$$

be the special dual like rectangular matrix number semiring. P is isomorphic with

$$
\begin{aligned}
& Q=\left\{\left[\begin{array}{llll}
x_{1} & x_{2} & \ldots & x_{10} \\
x_{11} & x_{12} & \ldots & x_{20} \\
x_{21} & x_{22} & \ldots & x_{30}
\end{array}\right]+\left[\begin{array}{cccc}
y_{1} & y_{2} & \ldots & y_{10} \\
y_{11} & y_{12} & \ldots & y_{20} \\
y_{21} & y_{22} & \ldots & y_{30}
\end{array}\right] g\right\} \\
& \mathrm{g}=\left[\begin{array}{ccccc}
7 & 8 & 7 & 8 & 7 \\
8 & 7 & 8 & 7 & 8
\end{array}\right] 8,7 \in \mathrm{Z}_{14} ; \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}, \\
& 1 \leq \mathrm{i}, \mathrm{j} \leq 30\} \text { as a semiring. }
\end{aligned}
$$

Now we just show if

$$
\mathrm{S}[\mathrm{x}]=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{i}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}}=\mathrm{t}_{\mathrm{i}}+\mathrm{s}_{\mathrm{i}} \mathrm{~g} \text { with } \mathrm{g}=7 \in \mathrm{Z}_{14} ; \mathrm{t}_{\mathrm{i}}, \mathrm{~s}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}\right\}
$$

then $\mathrm{S}[\mathrm{x}]$ isomorphic with

$$
\mathrm{P}=\left\{\sum_{\mathrm{i}=0}^{\infty}\left(\mathrm{t}_{\mathrm{i}}\right) \mathrm{x}^{\mathrm{i}}+\sum_{\mathrm{i}=0}^{\infty} \mathrm{s}_{\mathrm{i}} g \mathrm{x}^{\mathrm{i}} \text { with } \mathrm{g}=7 \in \mathrm{Z}_{14} ; \mathrm{t}_{\mathrm{i}}, \mathrm{~s}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}\right\} .
$$

For define $\eta: S[x] \rightarrow P$ by $\eta(p(x))=\eta\left(\sum_{i=0}^{\infty} a_{i} x^{i}\right)$

$$
=\eta\left(\sum_{i=0}^{\infty}\left(t_{i}+s_{i} g\right) x^{i}\right)=\sum_{i=0}^{\infty} t_{i} x^{i}+\left(\sum_{i=0}^{\infty} s_{i} x^{i}\right) g \in P .
$$

$\eta$ is 1-1 and is an isomorphism of semirings.
The results are true if coefficients of the polynomials are matrices with special dual like number entries.

## Chapter Three

## Higher Dimensional Special Dual Like Numbers

In this chapter we for the first time introduce the new notion of higher dimensional special dual like numbers. We study the properties associated with them. We also indicate the method of construction of any higher dimensional special dual like number space.

Let $\mathrm{x}=\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2}$ where $\mathrm{g}_{1}$ and $\mathrm{g}_{2}$ are idempotents such that $\mathrm{g}_{1} \mathrm{~g}_{2}=0=\mathrm{g}_{2} \mathrm{~g}_{1}$ and $\mathrm{a}, \mathrm{b}, \mathrm{c}$ are reals. We call x as the three dimensional special dual like number.

We first illustrate this situation by some examples.
Example 3.1: Let $\mathrm{x}=\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2}$ where $\mathrm{g}_{1}=3$ and $\mathrm{g}_{2}=4 ; 3$, $4 \in \mathrm{Z}_{6}$. x is a three dimensional special dual like number.

We see if $\mathrm{y}=\mathrm{c}+\mathrm{dg}_{1}+\mathrm{eg}_{2}$ another three dimensional dual like number then $\mathrm{x} \times \mathrm{y}=\left(\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2}\right)\left(\mathrm{c}+\mathrm{dg}_{1}+\mathrm{eg}_{2}\right)$

$$
\begin{aligned}
= & a c+b c g_{1}+c^{2} g_{2}+\text { adg }_{1}+b d g_{1}^{2}+\text { cdg }_{2} g_{1}+\text { aeg }_{2} \\
& + \text { beg }_{1} g_{2}+\text { ce }_{2}^{2} \\
= & a c+(b c+a d+b d) g_{1}+\left(c^{2}+a e+c e\right) g_{2} .
\end{aligned}
$$

We see once again xy is a three dimensional special dual like number.

Thus if $g_{1}$ and $g_{2}$ are two idempotents such that $g_{1}^{2}=g_{1}$ and $\mathrm{g}_{2}^{2}=\mathrm{g}_{2}$ with $\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=0$ then $R\left(g_{1}, g_{2}\right)=\left\{a+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{R}\right\}$ denotes the collection of all three dimensional special dual like numbers.

Clearly $\mathrm{R}\left(\mathrm{g}_{1}\right)=\left\{\mathrm{a}+\mathrm{bg}_{1} \mid \mathrm{a}, \mathrm{b} \in \mathrm{R}\right\} \subseteq \mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ and $R\left(g_{2}\right)=\left\{a+\operatorname{bg}_{2} \mid a, b \in R\right\} \subseteq R\left(g_{1}, g_{2}\right)$ we see $\left(R\left(g_{1}, g_{2}\right),+\right)$ is an abelian group under addition.

For if $\mathrm{x}=\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2}$ and $\mathrm{y}=\mathrm{c}+\mathrm{dg}_{1}+\mathrm{eg}_{2}$ are in $\mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ then $\mathrm{x}+\mathrm{y}=\mathrm{a}+\mathrm{c}(\mathrm{b}+\mathrm{d}) \mathrm{g}_{1}+(\mathrm{c}+\mathrm{d}) \mathrm{g}_{2}$ is in $\mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$.

Likewise $\mathrm{x}-\mathrm{y}=(\mathrm{a}-\mathrm{c})+(\mathrm{b}-\mathrm{d}) \mathrm{g}_{1}+(\mathrm{c}-\mathrm{e}) \mathrm{g}_{2}$ is in $\mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$. Further $\mathrm{x}+\mathrm{y}=\mathrm{y}+\mathrm{x}$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$.
$0=0+0 \mathrm{~g}_{1}+0 \mathrm{~g}_{2} \in \mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ is the additive identity in $R\left(g_{1}, g_{2}\right)$. Clearly for every $x=a+b g_{1}+\mathrm{cg}_{2}$ in $R\left(g_{1}, g_{2}\right)$ we have $-\mathrm{x}=-\mathrm{a}-\mathrm{bg}_{1}-\mathrm{cg}_{2}$ in $R\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right)$ is such that $\mathrm{x}+(-\mathrm{x})=(\mathrm{a}+$ $\mathrm{bg}_{1}+\mathrm{cg}_{2}+\left(-\mathrm{a}-\mathrm{bg}_{1}-\mathrm{cg}_{2}\right)=(\mathrm{a}-\mathrm{a})+(\mathrm{b}-\mathrm{b}) \mathrm{g}_{1}+(\mathrm{c}-\mathrm{c}) \mathrm{g}_{2}=0+$ $0 \mathrm{~g}_{1}+0 \mathrm{~g}_{2}=0$, thus for every x in $\mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ we see -x is in $R\left(g_{1}, g_{2}\right)$.

Further if $\mathrm{x}=\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2}$ and $\mathrm{y}=\mathrm{d}+\mathrm{eg}_{1}+\mathrm{fg}_{2} \in \mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ then $x \times y=y \times x$ and $x \times y \in R\left(g_{1}, g_{2}\right)$. We see $\left(R\left(g_{1}, g_{2}\right), x\right)$ is a semigroup in fact the semigroup is commutative with unit so is a monoid. Thus it is easily verified $\left(\mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right),+, \times\right)$ is a ring, infact a commutative ring with unit and has nontrivial zero divisors for $\mathrm{ag}_{1}$ and $\mathrm{bg}_{2}$ in $\mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ are such that $\mathrm{ag}_{1} \times \mathrm{bg}_{2}=0$, for all $a, b \in R$.

We define $\left(\mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right),+, \times\right)$ as the special general ring of special dual like numbers.

We call it "special general" as $R\left(g_{1}, g_{2}\right)$ contains also elements of the form $\mathrm{ag}_{1}, \mathrm{bg}_{2}$ and c where $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{R}$.

Example 3.2: Let $\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{R}, \mathrm{g}_{1}=7\right.$ and $\mathrm{g}_{2}$ $=8, g_{1}, g_{2} \in Z_{14}, g_{1}^{2}=7, g_{2}^{2}=8$ and $\left.g_{1} \times g_{2}=g_{2} \times g_{1}=0\right\}$ be the special general ring of three dimensional special dual like numbers.

In view of this we have the following theorem.
Theorem 3.1: Let $R\left(g_{1}, g_{2}\right)\left(Q\left(g_{1}, g_{2}\right)\right.$ or $\left.Z\left(g_{1}, g_{2}\right)\right)=\left\{a+b g_{1}\right.$ $+c g_{2} \mid a, b, c \in R, \mathrm{~g}_{1}^{2}=g_{1}, \mathrm{~g}_{2}^{2}=g_{2}$ and $\left.g_{1} g_{2}=g_{2} g_{1}=0\right\}$. $\left\{R\left(g_{1}, g_{2}\right),+, x\right\}$ is the special general ring of three dimensional special dual like numbers.

The proof is direct and hence is left as an exercise to the reader.

## Example 3.3: Let

$$
\mathrm{Z}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right)=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{~b}, \mathrm{c} \in \mathrm{Z}, \mathrm{~g}_{1}=5 ; \mathrm{g}_{2}=6, \mathrm{~g}_{1}, \mathrm{~g}_{2}\right.
$$ $\left.\in \mathrm{Z}_{10}\right\}$ be the special general ring of three dimensional special dual like number ring.

Example 3.4: Let $\mathrm{Z}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{Z}\right.$ and $\mathrm{g}_{1}$ $=\left(\begin{array}{lllll}1 & 0 & 1 & 0 & 0\end{array}\right)$ and $\left.g_{2}=(0110010)\right\}$.

We see $g_{1}^{2}=\left(\begin{array}{lllll}1 & 0 & 0 & 1 & 0\end{array} 01\right)=g_{1}$ and $g_{2}^{2}=\left(\begin{array}{lllll}0 & 1 & 1 & 0 & 0\end{array} 10\right)=$ $\mathrm{g}_{2}$ further $\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=\left(\begin{array}{lllll}0 & 0 & 0 & 0 & 0\end{array} 000\right.$ we see $\mathrm{Z}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ is a special general ring of special dual like numbers.

Example 3.5: Let

$$
\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{~b}, \mathrm{c} \in \mathrm{Q}, \mathrm{~g}_{1}=\left[\begin{array}{llll}
1 & 0 & 0 & 1 \\
0 & 1 & 1 & 0
\end{array}\right]\right. \text { and }
$$

$$
\begin{gathered}
\mathrm{g}_{2}=\left[\begin{array}{llll}
0 & 1 & 1 & 0 \\
1 & 0 & 0 & 1
\end{array}\right] ; \mathrm{g}_{1}^{2}=\left[\begin{array}{llll}
1 & 0 & 0 & 1 \\
0 & 1 & 1 & 0
\end{array}\right]=\mathrm{g}_{1} \text { and } \\
\left.\mathrm{g}_{2}^{2}=\left[\begin{array}{llll}
0 & 1 & 1 & 0 \\
1 & 0 & 0 & 1
\end{array}\right]=\mathrm{g}_{2} \text { with } \mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right]\right\}
\end{gathered}
$$

be the special general three dimensional ring of special dual like numbers.

We just show how product is performed.

$$
\begin{aligned}
& \text { Let } x=5+7\left[\begin{array}{llll}
1 & 0 & 0 & 1 \\
0 & 1 & 1 & 0
\end{array}\right]+3\left[\begin{array}{llll}
0 & 1 & 1 & 0 \\
1 & 0 & 0 & 1
\end{array}\right] \text { and } \\
& y=-2-4\left[\begin{array}{llll}
1 & 0 & 0 & 1 \\
0 & 1 & 1 & 0
\end{array}\right]+8\left[\begin{array}{llll}
0 & 1 & 1 & 0 \\
1 & 0 & 0 & 1
\end{array}\right] \text { be in } M .
\end{aligned}
$$

To find $\mathrm{x} \times \mathrm{y}=-10+(-14)\left[\begin{array}{llll}1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0\end{array}\right]+6\left[\begin{array}{llll}0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1\end{array}\right]$
$-20\left[\begin{array}{llll}1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0\end{array}\right]-28\left[\begin{array}{llll}1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0\end{array}\right]$
$-12 \times(0)+40\left[\begin{array}{llll}0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1\end{array}\right]+42(0)+24\left[\begin{array}{llll}0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1\end{array}\right]$
$=-10+(-62)\left[\begin{array}{llll}1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0\end{array}\right]+70\left[\begin{array}{llll}0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1\end{array}\right] \in \mathrm{M}$.

This is the way product on $M$ is performed.

## Example 3.6: Let

$$
\mathrm{S}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{~b}, \mathrm{c} \in \mathrm{R},\right.
$$

$$
\left.\mathrm{g}_{1}=\left[\begin{array}{l}
1 \\
1 \\
0 \\
1 \\
1 \\
0 \\
1
\end{array}\right] \text { and } \mathrm{g}_{2}=\left[\begin{array}{l}
0 \\
0 \\
1 \\
0 \\
0 \\
1 \\
0
\end{array}\right]\right\}
$$

be a special general ring of special dual like numbers.

$$
\begin{gathered}
\text { Suppose } \mathrm{x}=3+2\left[\begin{array}{l}
1 \\
1 \\
0 \\
1 \\
1 \\
0 \\
1
\end{array}\right]+\left[\begin{array}{l}
0 \\
0 \\
1 \\
0 \\
0 \\
1 \\
0
\end{array}\right] \text { and } \\
\mathrm{y}=-3-2\left[\begin{array}{l}
1 \\
1 \\
0 \\
1 \\
1 \\
0 \\
1
\end{array}\right]+\left[\begin{array}{l}
0 \\
0 \\
1 \\
0 \\
0 \\
1 \\
0
\end{array}\right] \text { are in } \mathrm{S}
\end{gathered}
$$

We find $\mathrm{x} \times \mathrm{y}=\left(3+2\left[\begin{array}{l}1 \\ 1 \\ 0 \\ 1 \\ 1 \\ 0 \\ 1\end{array}\right]+7\left[\begin{array}{l}0 \\ 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0\end{array}\right]\right) \times$

$$
\left(-3-2\left[\begin{array}{l}
1 \\
1 \\
0 \\
1 \\
1 \\
0 \\
1
\end{array}\right]+7\left[\begin{array}{l}
0 \\
0 \\
1 \\
0 \\
0 \\
1 \\
0
\end{array}\right]\right)
$$

$$
\begin{aligned}
&=-9-6\left[\begin{array}{l}
1 \\
1 \\
0 \\
1 \\
1 \\
0 \\
1
\end{array}\right]-37\left[\begin{array}{l}
0 \\
0 \\
1 \\
0 \\
0 \\
1 \\
0
\end{array}\right]-6\left[\begin{array}{l}
1 \\
1 \\
0 \\
1 \\
1 \\
0 \\
1
\end{array}\right]-4\left[\begin{array}{l}
1 \\
1 \\
0 \\
1 \\
1 \\
0 \\
1
\end{array}\right]+14\left[\begin{array}{l}
0 \\
0 \\
0 \\
0 \\
0 \\
0 \\
0
\end{array}\right] \\
&+21\left[\begin{array}{l}
0 \\
0 \\
1 \\
0 \\
0 \\
1 \\
0
\end{array}\right]+14\left[\begin{array}{l}
0 \\
0 \\
0 \\
0 \\
0 \\
0 \\
0
\end{array}\right]+\left[\begin{array}{l}
0 \\
0 \\
1 \\
0 \\
0 \\
1 \\
0
\end{array}\right] \\
&=-9-16\left[\begin{array}{l}
1 \\
1 \\
0 \\
1 \\
1 \\
0 \\
1
\end{array}\right]+25\left[\begin{array}{l}
0 \\
0 \\
1 \\
0 \\
0 \\
1 \\
1
\end{array}\right]
\end{aligned}
$$

Thus $(\mathrm{S},+, \times)$ is a special general ring of special dual like numbers.

Now we can as in case of dual numbers define general matrix ring of special dual like numbers. However the definition is a matter of routine.

Now we illustrate this situation only by examples.

Example 3.7: Let $\mathrm{S}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \mathrm{a}_{4}, \mathrm{a}_{5}, \mathrm{a}_{6}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{1} \mathrm{~g}_{1}+\mathrm{z}_{1} \mathrm{~g}_{2}\right.$ where $\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}}, \mathrm{z}_{\mathrm{i}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 6, \mathrm{~g}_{1}=4$ and $\left.\mathrm{g}_{2}=3,3,4 \in \mathrm{Z}_{6}\right\}$ be the general special ring of special dual like numbers.

We see $(S,+)$ is an abelian group for if $x=\left(a_{1}, a_{2}, a_{3}, a_{4}, a_{5}, a_{6}\right)$ and $y=\left(b_{1}, b_{2}, b_{3}, b_{4}, b_{5}, b_{6}\right)$ are in $S$ then
$x+y=\left(a_{1}+b_{1}, a_{2}+b_{2}, a_{3}+b_{3}, a_{4}+b_{4}, a_{5}+b_{5}, a_{6}+b_{6}\right)$ is in $S$.
Consider $\mathrm{x} \times \mathrm{y}=\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{6}\right) \times\left(\mathrm{b}_{1}, \mathrm{~b}_{2}, \ldots, \mathrm{~b}_{6}\right)$
$=\left(a_{1} b_{1}, a_{2} b_{2}, \ldots, a_{6} b_{6}\right), x \times y \in S$. Thus $(S,+, \times)$ is a special general ring of row matrix special dual like numbers.

Let $P=\left\{a+b g_{1}+c g_{2} \mid a=\left(a_{1}, a_{2}, \ldots, a_{6}\right), b=\left(b_{1}, b_{2}, \ldots, b_{6}\right)\right.$ and $\mathrm{c}=\left(\mathrm{c}_{1}, \mathrm{c}_{2}, \ldots, \mathrm{c}_{6}\right)$ with $\mathrm{g}_{2}=3$ and $\mathrm{g}_{1}=4,3,4 \in \mathrm{Z}_{6} ; 3^{2}=3$ $(\bmod 6), 4^{2}=4(\bmod 6)$ and $\left.3.4=4.3 \equiv 0(\bmod 6)\right\}$ is also a special general ring of row matrices of special dual like numbers. Clearly P is isomorphic with S as rings.

## Example 3.8: Let

$$
M=\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4} \\
a_{5}
\end{array}\right] \text { where } \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{~g}_{\mathrm{i}}+\mathrm{zg}_{2}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}}, \mathrm{z}_{\mathrm{i}} \in \mathrm{Z} ; 1 \leq \mathrm{i} \leq 5
$$

$\mathrm{g}_{1}=7$ and $\mathrm{g}_{2}=8$ with $\left.7,8 \in \mathrm{Z}_{14}\right\}$ be the special general ring of column matrices of special dual like numbers under the natural product $\times_{n}$.

We see if $x=\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3} \\ a_{4} \\ a_{5}\end{array}\right]$ and $y=\left[\begin{array}{l}b_{1} \\ b_{2} \\ b_{3} \\ b_{4} \\ b_{5}\end{array}\right]$ are in $M$, then

$$
\begin{aligned}
& x+y=\left[\begin{array}{l}
a_{1}+b_{1} \\
a_{2}+b_{2} \\
a_{3}+b_{3} \\
a_{4}+b_{4} \\
a_{5}+b_{5}
\end{array}\right] \text { is in M. } \\
& \text { We find } x x_{n} y=\left[\begin{array}{l}
a_{2} \\
a_{3} \\
a_{4} \\
a_{5}
\end{array}\right] \times_{n}\left[\begin{array}{l}
a_{1} \\
b_{2} \\
b_{3} \\
b_{4} \\
b_{5}
\end{array}\right]=\left[\begin{array}{l}
b_{1} \\
a_{3} b_{3} \\
a_{4} b_{4} \\
a_{5} b_{5}
\end{array}\right] \in M . \\
& \text { Suppose } N=\left\{\begin{array}{l}
a_{1} b_{1} \\
a_{2} b_{2} \\
a_{2} \\
x_{2} \\
x_{2} \\
x_{4} \\
x_{5}
\end{array}\right]+\left[\begin{array}{l}
y_{1} \\
y_{2} \\
y_{3} \\
y_{4} \\
y_{5}
\end{array}\right]\left[\begin{array}{l}
z_{1} \\
z_{1}+\left[\begin{array}{l}
z_{2} \\
z_{3} \\
z_{4} \\
z_{5}
\end{array}\right]\left[\begin{array}{l}
g_{2}
\end{array}\right]
\end{array} . \begin{array}{l}
x_{i}, y_{i}, z_{i} \in Z,
\end{array}\right.
\end{aligned}
$$

$1 \leq \mathrm{i}, \mathrm{j}, \mathrm{k} \leq 5$ with $\mathrm{g}_{1}=7$ and $\mathrm{g}_{2}=8$ in $\left.\mathrm{Z}_{14}\right\}$ is again a special general ring of column matrix special dual like numbers.

We see clearly $M$ and $N$ are isomorphic as rings under the natural product $\times_{n}$.

Example 3.9: Let

$$
S=\left\{\left[\begin{array}{llll}
a_{1} & a_{2} & a_{3} & a_{4} \\
a_{5} & a_{6} & a_{7} & a_{8} \\
a_{9} & a_{10} & a_{11} & a_{12}
\end{array}\right] \text { where } a_{i}=x_{i}+y_{i} g_{1}+z_{i} g_{2}\right.
$$

with $\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}}, \mathrm{z}_{\mathrm{i}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 12 ; \mathrm{g}_{1}=(7,8,7,8,0)$ and

$$
\left.\mathrm{g}_{2}=(8,7,8,7,8) \text { with } 7,8 \in \mathrm{Z}_{14}\right\}
$$

be the special general ring of $3 \times 4$ matrices of special dual like numbers under natural product $\times_{n}$.

$$
\begin{gathered}
\text { Suppose } x=\left[\begin{array}{llll}
a_{1} & a_{2} & a_{3} & a_{4} \\
a_{5} & a_{6} & a_{7} & a_{8} \\
a_{9} & a_{10} & a_{11} & a_{12}
\end{array}\right] \text { and } \\
y=\left[\begin{array}{llll}
b_{1} & b_{2} & b_{3} & b_{4} \\
b_{5} & b_{6} & b_{7} & b_{8} \\
b_{9} & b_{10} & b_{11} & b_{12}
\end{array}\right] \text { are in } S \text {, } \\
\text { then } x+y=\left[\begin{array}{llll}
a_{1}+b_{1} & a_{2}+b_{2} & a_{3}+b_{3} & a_{4}+b_{4} \\
a_{5}+b_{5} & a_{6}+b_{6} & a_{7}+b_{7} & a_{8}+b_{8} \\
a_{9}+b_{9} & a_{10}+b_{10} & a_{11}+b_{11} & a_{12}+b_{12}
\end{array}\right] \text { is in } S . \\
\text { We find } x x_{n} y=\left[\begin{array}{llll}
a_{1} b_{1} & a_{2} b_{2} & a_{3} b_{3} & a_{4} b_{4} \\
a_{5} b_{5} & a_{6} b_{6} & a_{7} b_{7} & a_{8} b_{8} \\
a_{9} b_{9} & a_{10} b_{10} & a_{11} b_{11} & a_{12} b_{12}
\end{array}\right] \in S .
\end{gathered}
$$

Thus $\left(\mathrm{S},+, \times_{\mathrm{n}}\right)$ is the special matrix general ring of special dual like numbers.

Finally we give an example of the notion of special general square matrix special dual like number ring.

## Example 3.10: Let

$$
P=\left\{\left.\left[\begin{array}{cccc}
a_{1} & a_{2} & a_{3} & a_{4} \\
a_{5} & a_{6} & a_{7} & a_{8} \\
a_{9} & a_{10} & a_{11} & a_{12} \\
a_{13} & a_{14} & a_{15} & a_{16}
\end{array}\right] \right\rvert\, a_{i}=t_{i}+s_{i} g_{1}+r_{i} g_{2}\right.
$$

where $\mathrm{t}_{\mathrm{i}}, \mathrm{s}_{\mathrm{i}}, \mathrm{r}_{\mathrm{i}} \in \mathrm{Q}, 1 \leq \mathrm{i} \leq 16, \mathrm{~g}_{1}=\left[\begin{array}{c}13 \\ 14 \\ 0 \\ 13 \\ 14\end{array}\right]$ and $\mathrm{g}_{2}=\left[\begin{array}{c}14 \\ 13 \\ 13 \\ 0 \\ 0\end{array}\right]$

$$
\text { with } \left.13,14 \in Z_{26}\right\}
$$

be the special general ring special dual like numbers of square matrices under the usual product $\times$ or the natural product $\times_{n}$. Clearly P is a three dimensional commutative ring under $\times_{\mathrm{n}}$.

Now we just show how we can generate the idempotents so that $\mathrm{x}=\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2}$ forms a three dimensional special dual like numbers.

We get these idempotents from various sources.
(i) From the idempotents of $\mathrm{Z}_{\mathrm{n}}$ ( n not a prime or a prime power) has atleast two non trivial idempotents.
(ii) From the standard basis of any vector space.

For if $x=\left(\begin{array}{lllllll}1 & 0 & 0 & 0 & 0 & \ldots\end{array}\right)$ and $y=(0,1,0, \ldots, 0)$ we see $x^{2}=x, y^{2}=y$ and $x y=y x=(0,0, \ldots, 0)$.

This is true even if $\mathrm{x}=\left[\begin{array}{c}0 \\ 0 \\ 0 \\ 0 \\ 0 \\ \vdots \\ 0 \\ 1\end{array}\right]$ and $\mathrm{y}=\left[\begin{array}{c}0 \\ 0 \\ \vdots \\ 0 \\ 1 \\ 0\end{array}\right]$;

$$
\begin{aligned}
& x x_{n} x=x, y x_{n} y=y \text { and } x x_{n} y=y x_{n} x=\left[\begin{array}{c}
0 \\
0 \\
\vdots \\
0
\end{array}\right] \text {. } \\
& \text { Also if } x=\left[\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right] \text { and } y=\left[\begin{array}{ll}
0 & 1 \\
0 & 0
\end{array}\right] \text { then } \\
& x \times_{n} y=\left[\begin{array}{ll}
0 & 0 \\
0 & 0
\end{array}\right]=y \times_{n} y, x \times_{n} x=\left[\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right] \\
& \text { and } \mathrm{y} \times_{\mathrm{n}} \mathrm{y}=\left[\begin{array}{ll}
0 & 1 \\
0 & 0
\end{array}\right] \text {. } \\
& \text { Finally if } x=\left[\begin{array}{ccccc}
1 & 0 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0
\end{array}\right] \text { and } y=\left[\begin{array}{ccccc}
0 & 1 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0
\end{array}\right] \\
& \text { then also } \mathrm{x} \times_{\mathrm{n}} \mathrm{y}=\left[\begin{array}{lllll}
0 & 0 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0
\end{array}\right]=\mathrm{y} \times_{\mathrm{n}} \mathrm{x} \text { and } \\
& \mathrm{x} \times_{\mathrm{n}} \mathrm{x}=\left[\begin{array}{ccccc}
1 & 0 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0
\end{array}\right] \text { and } \mathrm{y} \times_{\mathrm{n}} \mathrm{y}=\left[\begin{array}{ccccc}
0 & 1 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0 \\
0 & 0 & 0 & \ldots & 0
\end{array}\right] \text {. }
\end{aligned}
$$

All these idempotents can contribute for three dimensional special dual like number.
(iii) We know if we have a normal operator T on a finite dimensional complex inner product space V or a selfadjoint operator on a finite dimensional real inner product space V .

Suppose $\mathrm{c}_{1}, \mathrm{c}_{2}, \ldots, \mathrm{c}_{\mathrm{k}}$ are distinct eigen values of $\mathrm{T}, \mathrm{W}_{\mathrm{j}}$ 's the characteristic space associated with $c_{j}$ and $E_{j}$ the orthogonal projection of V on $\mathrm{W}_{\mathrm{j}}$. Then $\mathrm{W}_{\mathrm{j}}$ is orthogonal to $\mathrm{W}_{\mathrm{i}}(\mathrm{i} \neq \mathrm{j})$. $\mathrm{E}_{\mathrm{i}}{ }^{\prime}$ s are such that $E_{i}^{2}=E_{i}, i=1,2, \ldots, k$ so we can have special dual like numbers of higher dimension can be got from this set of projections.
(iv) If we take either the elements of a lattice or a semilattice we get idempotents. All the more if we take the atoms of a lattice say $a_{1}, \ldots, a_{n}$ then we always have $a_{i} \cap a_{j}=0$ if $i \neq j$ and $a_{i} \cap a_{i}=a_{i} ; 1 \leq i, j \leq M$. By this method also we can get a collection of special dual like numbers.

Finally we can construct matrices using these special dual like numbers to get any desired dimension of special dual like numbers.

Now we will illustrate them and describe by a ndimensional special dual like numbers.

Let $\mathrm{x}=\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{a}_{\mathrm{n}} \mathrm{g}_{\mathrm{n}-1}$ be such that $\mathrm{a}_{\mathrm{i}} \in \mathrm{R}$ (or Q or Z), $1 \leq \mathrm{i} \leq \mathrm{n}$ and $\mathrm{g}_{\mathrm{j}}$ 's are such that $\mathrm{g}_{\mathrm{j}}^{2}=\mathrm{g}_{\mathrm{j}}, \mathrm{g}_{\mathrm{j}} . \mathrm{g}_{\mathrm{i}}=\mathrm{g}_{\mathrm{k}}$ or 0 if $\mathrm{i} \neq \mathrm{j} ; 1 \leq \mathrm{i}, \mathrm{k}, \mathrm{j} \leq \mathrm{n}-1$. We see $\mathrm{x}^{2}=\mathrm{A}_{1}+\mathrm{A}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{A}_{\mathrm{n}} \mathrm{g}_{\mathrm{n}-1}$ where $A_{j} \in R(1 \leq j \leq n)$.

We will first illustrate this situation by some examples.
Example 3.11: Let $x=a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}$ where $a_{i} \in R$;

$1 \leq \mathrm{i} \leq 4$ and $\mathrm{g}_{1}, \mathrm{~g}_{2}$ and $\mathrm{g}_{3}$ are marked in the diagram and $\mathrm{g}_{\mathrm{i}} \cap \mathrm{g}_{\mathrm{j}}$ $=g_{k}$ or 0 if $i \neq j$ and $g_{i} \cap g_{i}=g_{i} ; 1 \leq i, j, k \leq 3$.

Of course we can take ' $\checkmark$ ' as operation and still the compatibility is true.

Example 3.12: Suppose we take $x=a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}$ with $\mathrm{a}_{\mathrm{i}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 4$ and $\mathrm{g}_{1}, \mathrm{~g}_{2}$ and $\mathrm{g}_{3}$ from the lattice

we see we cannot claim $x$ to be special dual like number of dimension three as this lattice is not distributive.

We so just define the following new concept.
DEFINITION 3.1: Let $F$ be the field or a commutative ring with unit. L be a distriblute lattice of finite order say $n+1$.
$F L=\left\{\sum_{\mathrm{i}} \mathrm{a}_{\mathrm{i}} \mathrm{m}_{\mathrm{i}} \mid a_{i} \in F\right.$ and $\left.m_{i} \in L ; 0 \leq i \leq n+1\right\}(L=\{0=$
$\left.m_{0}, m_{1}, m_{2}, \ldots, m_{n+1}=1\right\}$ ). We define + and $\times$ on FL as follows:
(1) For $x=\sum a_{i} m_{i}$ and $y \sum b_{i} m_{i}$ in FL; $x=y$ in and only if $a_{i}=b_{i}$ for $i=0, \ldots, n+1$.
(2) $0 . m_{i}=0, i=0, i, \ldots, n+1$ and $a m_{0}=0$ for all $a \in F$.
(3) $x+y=\sum\left(a_{i}+b_{i}\right) m_{i}$ for all $x, y \in F L$.
(4) $x .1=1 . x=x$ for $m_{n+1}=1 \in L$ for all $x \in F$.
(5) $x \times y=\sum a_{i} m_{i} \times \sum b_{i} m_{i}$

$$
\begin{aligned}
& =\sum_{i} a_{i} b_{j}\left(m_{i} \cap m_{j}\right) \\
& =\sum_{\mathrm{k}} \mathrm{a}_{\mathrm{k}} \mathrm{~m}_{\mathrm{k}}
\end{aligned}
$$

(or equivalently $\sum a_{i} b_{j}\left(m_{i} \cup m_{j}\right)=x \times y=\sum a_{k} m_{k}$ ).
(6) $a m_{i}=m_{i} a$ for all $a \in F$ and $m_{i} \in L$.
(7) $x \times(y+z)=x x y+x \times z$ for all $x, y, z \in F L$.

Thus FL is a ring, which is defined as a ring lattice.
We see the ring lattice is a $n$-dimensional general ring of special dual like numbers.

We will illustrate this situation by some simple examples.
Example 3.13: Let L =

be a distribute lattice. Q be the ring of rational. QL be the lattice ring.

$$
\mathrm{QL}=\left\{\mathrm{m}_{0}+\mathrm{m}_{1} \mathrm{a}+\mathrm{m}_{2} \mathrm{~b} \mid \mathrm{m}_{0}, \mathrm{~m}_{1}, \mathrm{~m}_{2} \in \mathrm{Q} \text { and } \mathrm{a}, \mathrm{~b} \in \mathrm{~L}\right\} .
$$

We just show how product is performed on QL.
Take $x=5-3 a+8 b$ and $y=-10+8 a-7 b$ in QL.

$$
\begin{aligned}
x+y & =-5+5 a+b \in Q L . \\
x \times y & =(5-3 a+8 b)(-10+8 a-7 b) \\
& =-50+30 a-80 b+40 a-24 a+8 \times 8(b \cap a) \\
& \quad-35 b+21(a \cap b)-56 b \\
& =-50+46 a-91 b \in Q L .
\end{aligned}
$$

Thus QL is a three dimensional general ring of special dual like numbers.

Suppose we take ' $\cup$ ' as the operation on QL.

$$
\begin{aligned}
x \times y & =(5-3 a+8 b)(-10+8 a-7 b) \\
& =-50+30 a-80 b+40 a-42 a+8 \times 8(b \cup a)-35 b+ \\
& =-50+46 a-91 b+64+21 \\
& =35+46 a-91 b \in Q L .
\end{aligned}
$$

Example 3.14: Let Z be the ring of integers. L be the chain lattice given by

$Z L=\left\{\sum_{i=0}^{6} a_{i} m_{i} \mid m_{i} \in Z\right.$ and $\left.a_{i} \in L ; 0 \leq i \leq 6\right\}$ be the lattice ring.
ZL is a 5-dimensional special general ring of special dual like numbers.

Suppose $\mathrm{x}=\mathrm{m}_{1}+\mathrm{m}_{2} \mathrm{a}_{1}+\mathrm{m}_{3} \mathrm{a}_{2}+\mathrm{m}_{4} \mathrm{a}_{3}+\mathrm{m}_{5} \mathrm{a}_{4}+\mathrm{m}_{6} \mathrm{a}_{5}$ and
$y=n_{1}+n_{2} a_{1}+n_{3} a_{2}+n_{4} a_{3}+n_{5} a_{4}+n_{6} a_{5}$ are in ZL, then we can find $x y$ and $x+y$.

Suppose $y=-7-5 a_{2}+3 a_{4}+6 a_{5}$ and $x=3+4 a_{1}+5 a_{2}-8 a_{3}$ are in ZL.

$$
\begin{aligned}
& x+y=-4+4 a_{1}+0-8 a_{3}+3 a_{4}+6 a_{5} \text { and } \\
& x \times y=\left(3+4 a_{1}+5 a_{2}-8 a_{3}\right)\left(-7-5 a_{2}+3 a_{4}+6 a_{5}\right) \\
&=-21-28 a_{1}-35 a_{2}+56 a_{3}-15 a_{2}-20 a_{1}- \\
& \quad 25 a_{2}+40 a_{2}+9 a_{4}+12 a_{1}+15 a_{2}-24 a_{3}+18 a_{5}+ \\
& \quad 24 a_{1}+30 a_{2}-48 a_{3}
\end{aligned}
$$

$$
=-21-12 a_{1}+10 a_{2}-16 a_{3}+9 a_{4}+18 a_{5} \in Z L
$$

Thus ZL is a six dimensional general ring of special dual like numbers.

Example 3.15: Let Z be the ring of integers. L be a lattice given by the following diagram.

L is a distribute lattice. ZL be the lattice ring given by $\mathrm{ZL}=$ $\left\{\mathrm{m}_{1}+\mathrm{m}_{2} \mathrm{a}_{1}+\ldots+\mathrm{m}_{6} \mathrm{a}_{6} \mid \mathrm{a}_{\mathrm{j}} \in \mathrm{L} ; \mathrm{m}_{\mathrm{i}} \in \mathrm{Z} ; 1 \leq \mathrm{i} \leq 6,1 \leq \mathrm{j} \leq 6\right\}$.

Take $\mathrm{x}=3+4 \mathrm{a}_{4}+5 \mathrm{a}_{6}$ and $\mathrm{y}=4-2 \mathrm{a}_{2}+3 \mathrm{a}_{5}$ we find $\mathrm{x}+\mathrm{y}$ and $\mathrm{x} \times \mathrm{y}$ (where product on L is taken as ' $\cup$ '.

$$
\begin{aligned}
& x+y=7-2 a_{2}+4 a_{4}+3 a_{5}+5 a_{6} . \\
& x \times y=\left(3+4 a_{4}+5 a_{6}\right) \times\left(4-2 a_{2}+3 a_{5}\right) \\
& =12+16 a_{4}+20 a_{6}-6 a_{2}-8 a_{2}-10 a_{2}+9 a_{5}+12 a_{3}+15 a_{1} \\
& =12+15 a_{1}-24 a_{2}+12 a_{3}+16 a_{4}+9 a_{5}+20 a_{6} \in Z L .
\end{aligned}
$$

Suppose we replace ' $\cup$ ' by ' $\cap$ ' on ZL then $\mathrm{x} \times \mathrm{y}$;
$x \times y=\left(3+4 a_{4}+5 a_{6}\right)\left(4-2 a_{2}+3 a_{5}\right)$
$=12+16 a_{4}+20 a_{6}-6 a_{2}-8 a_{4} \cap a_{2}-10 a_{6} \cap a_{2}+$ $9 a_{5}+12 a_{5} \cap a_{4}+15 a_{6} \cap a_{4}$
$=12+16 a_{4}+20 a_{6}-6 a_{2}-8 a_{4}-10 a_{6}+9 a_{5}+$ $12 \times 0+15 \times 0$.
$=12+8 a_{4}+10 a_{6}+9 a_{5}-6 a_{2} \in Z L$.

Clearly $\mathrm{x} \times \mathrm{y} \neq \mathrm{x} \otimes \mathrm{y}$ for we see $\times$ is under ' $\cup$ ' and $\otimes$ is under ' $\cap$ '.

Example 3.16: Let R be the field of reals. $\mathrm{L}=$

be a lattice. RL be the lattice ring RL is a 5 -dimensional general ring of special and like numbers.

Thus lattices help in building special dual like number general ring. However we get two types of general rings of special dual like number rings depending on the operation ' $\cup$ ' or ' $\cap$ '.

Example 3.17: Let F be a field. $\mathrm{M}=\{(0,0,0,0,0,0),(1,0,0$, $0,0,0),(0,1,0,0,0,0)(0,0,1,0,0,0),(0,0,0,1,0,0),(0,0$, $0,0,1,0),(0,0,0,0,0,1)\}$ be the semigroup under product. $F M=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}+a_{5} g_{4}+a_{6} g_{5}+a_{7} g_{6} \mid g_{1}=(1,0,0\right.$, $0,0,0), \mathrm{g}_{2}=(0,1,0,0,0,0), \mathrm{g}_{3}=(0,0,1,0,0,0), \mathrm{g}_{4}=(0,0,0$, $1,0,0), \mathrm{g}_{5}=(0,0,0,0,1,0)$ and $\mathrm{g}_{6}=(0,0,0,0,0,1)$ where $\mathrm{g}_{\mathrm{i}}^{2}$ $\left.=g_{i}, 1 \leq i \leq 6\right\}$ be the seven dimensional general ring of special dual like numbers.

Example 3.18: Let $\mathrm{F}=\mathrm{Q}$ be the field. $\mathrm{S}=\{(0,0,0,0),(1,0,0,0),(0,1,0,0),(0,0,0,1),(0,0,1,0)\}$ be the idempotent five dimensional general ring of special dual like numbers.

Example 3.19: Let $\mathrm{F}=\mathrm{R}$ be the field.
$\mathrm{S}=\{(0,0, \ldots, 0),(1,0, \ldots, 0) \ldots(0,0, \ldots, 0,1)\}$ be the idempotent semigroup of order $\mathrm{n}+1$. Clearly FS the semigroup ring is a $n+1$ dimensional general ring of special dual like numbers.

Example 3.20: Let V be a vector space over a field R. $\mathrm{W}_{1}, \mathrm{~W}_{2}$, $\ldots, W_{t}$ be $t$ vector subspaces of $V$ over $R$ such that
$\mathrm{V}=\mathrm{W}_{1} \oplus \mathrm{~W}_{2} \oplus \ldots \oplus \mathrm{~W}_{\mathrm{t}}$ is a direct sum. Suppose $\mathrm{E}_{1}, \mathrm{E}_{2}$, $\ldots, E_{t}$ be $t$ projection operator on $W_{1}, W_{2}, \ldots, W_{t}$ respectively. I be the identity operator.

Now $S=\left\{a_{1}+a_{2} E_{1}+a_{3} E_{2}+\ldots .+a_{t+1} E_{t} \mid a_{i} \in R ; 1 \leq i \leq t+\right.$ 1 ; $\mathrm{F}_{\mathrm{j}}$ is a projection of V onto $\left.\mathrm{W}_{\mathrm{j}} ; 1 \leq \mathrm{j} \leq \mathrm{t}\right\} ; \mathrm{S}$ is a general $\mathrm{t}+1$ dimensional ring of special dual like (operators) numbers.

In this way we get any desired dimensional special dual like operator general rings.

Finally show how we construct special dual like rings using idempotents in $\mathrm{Z}_{\mathrm{n}}$.

Example 3.21: Let $\mathrm{Z}_{\mathrm{n}}$ be the ring of integers. $\mathrm{S}=\left\{\mathrm{g}_{1}, \mathrm{~g}_{2}, \ldots\right.$, $\left.\mathrm{g}_{\mathrm{t}}, 0\right\}$ be idempotents of S such that $\left\{\mathrm{m}_{1}+\mathrm{m}_{2} \mathrm{~g}_{1}+\mathrm{m}_{3} \mathrm{~g}_{2}+\ldots+\right.$ $\left.\mathrm{m}_{\mathrm{t}+1} \mathrm{~g}_{\mathrm{t}} \mid \mathrm{m}_{\mathrm{i}} \in \mathrm{R} ; 1 \leq \mathrm{i} \leq \mathrm{t}+1 ; \mathrm{g}_{\mathrm{j}} \in \mathrm{S} ; 1 \leq \mathrm{j} \leq \mathrm{t}\right\} ; \mathrm{P}$ is a $\mathrm{t}+1$ dimensional general ring of special dual like numbers.

Example 3.22: Let $\mathrm{Z}_{\mathrm{n}}$ be the ring of modulo integers. $\mathrm{S}=\{0$, $\left.\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}, \mathrm{~g}_{4}\right\} \subseteq \mathrm{Z}_{\mathrm{n}}$ be idempotents such that $\mathrm{g}_{\mathrm{i}}^{2}=\mathrm{g}_{\mathrm{i}} ; 1 \leq \mathrm{i} \leq 4$; $\mathrm{g}_{\mathrm{i}} \mathrm{g}_{\mathrm{j}}=0$ or $\mathrm{g}_{\mathrm{k}} ; 1 \leq \mathrm{i}, \mathrm{j}, \mathrm{k} \leq 4$.

Consider $\mathrm{P}=\left\{\left[\begin{array}{l}0 \\ \mathrm{~g}_{1} \\ \mathrm{~g}_{2}\end{array}\right],\left[\begin{array}{c}0 \\ \mathrm{~g}_{2} \\ 0\end{array}\right],\left[\begin{array}{c}\mathrm{g}_{1} \\ 0 \\ 0\end{array}\right],\left[\begin{array}{c}\mathrm{g}_{2} \\ 0 \\ 0\end{array}\right],\left[\begin{array}{l}0 \\ 0 \\ 0\end{array}\right], \left.\left[\begin{array}{l}0 \\ 0 \\ \mathrm{~g}_{1}\end{array}\right] \right\rvert\, \mathrm{g}_{1} . \mathrm{g}_{2}=0\right\}$.

Suppose
$B=\left\{\left.a_{1}+a_{2}\left[\begin{array}{c}0 \\ 0 \\ g_{1}\end{array}\right]+a_{3}\left[\begin{array}{c}0 \\ g_{1} \\ g_{2}\end{array}\right]+a_{4}\left[\begin{array}{c}0 \\ g_{2} \\ 0\end{array}\right]+a_{5}\left[\begin{array}{c}g_{1} \\ 0 \\ 0\end{array}\right]+a_{6}\left[\begin{array}{c}g_{2} \\ 0 \\ 0\end{array}\right] \right\rvert\, a_{i} \in R\right.$,
$1 \leq \mathrm{i} \leq 6\}$. B is a 6 -dimensional special dual like number general ring.

We can construct idempotent semigroup or matrices using the idempotents in $\mathrm{Z}_{\mathrm{n}}$. Using these idempotent matrices we can build any desired dimensional general ring of special dual like numbers.

Now having seen methods of constructing different types of special dual like numbers of desired dimension. Now we can also construct t -dimensional special semiring semifield of special dual like numbers.

We illustrate this only by examples.
Example 3.23: Let $\mathrm{M}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3}+\mathrm{a}_{5} \mathrm{~g}_{4}+\mathrm{a}_{6} \mathrm{~g}_{5} \mid \mathrm{a}_{\mathrm{i}}\right.$ $\in \mathrm{Z}^{+}, 1 \leq \mathrm{i} \leq 5, \mathrm{~g}_{1}=(1,0,0,0,0), \mathrm{g}_{2}=(0,1,0,0,0), \mathrm{g}_{3}=(0,0$, $1,0,0), \mathrm{g}_{4}=(0,0,0,1,0)$ and $\left.\mathrm{g}_{5}=(0,0,0,0,1)\right\} \cup\{0\}$ be the 6 dimensional general semifield of special dual like numbers.

## Example 3.24: Let

$$
\begin{gathered}
S=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}+a_{5} g_{4} \mid a_{i} \in Z^{+}, 1 \leq i \leq 4,\right. \\
\left.g_{1}=\left[\begin{array}{l}
1 \\
0 \\
0 \\
0
\end{array}\right], g_{2}=\left[\begin{array}{l}
0 \\
1 \\
0 \\
0
\end{array}\right], g_{3}=\left[\begin{array}{l}
0 \\
0 \\
1 \\
0
\end{array}\right] \text { and } g_{4}=\left[\begin{array}{l}
0 \\
0 \\
0 \\
1
\end{array}\right]\right\} \cup\left\{\left[\begin{array}{l}
0 \\
0 \\
0 \\
0
\end{array}\right]\right\}
\end{gathered}
$$

be the special dual like number semifield of dimension five.

Example 3.25: Let

$$
\begin{gathered}
M=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+\ldots+a_{7} g_{8} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Q}^{+} ; 1 \leq \mathrm{i} \leq 9 ;\right. \\
\mathrm{g}_{1}=\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0
\end{array}\right], \mathrm{g}_{2}=\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right], \mathrm{g}_{3}=\left[\begin{array}{cccc}
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 0
\end{array}\right], \\
\mathrm{g}_{4}=\left[\begin{array}{llll}
0 & 0 & 0 & 1 \\
0 & 0 & 0 & 0
\end{array}\right], \mathrm{g}_{5}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0
\end{array}\right], \mathrm{g}_{6}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0
\end{array}\right], \\
\mathrm{g}_{7}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 1 & 0
\end{array}\right] \text { and } \mathrm{g}_{8}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right] ; \\
\mathrm{g}_{\mathrm{i}} \times_{\mathrm{n}} \mathrm{~g}_{\mathrm{j}}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right] \text { if } \mathrm{i} \neq \mathrm{j} ; \mathrm{g}_{\mathrm{i}}^{2}=\mathrm{g}_{\mathrm{i}} \\
\text { for } \mathrm{i}=1,2, \ldots, 8\} \cup\{0\}
\end{gathered}
$$

be the special semifield of special dual like numbers of dimension of nine.

Example 3.26: Let

$$
\begin{gathered}
S=\left\{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3}
\end{array}\right]+\left[\begin{array}{l}
b_{1} \\
b_{2} \\
b_{3}
\end{array}\right] g_{1}+\left[\begin{array}{l}
c_{1} \\
c_{2} \\
c_{3}
\end{array}\right] g_{2}+\left[\begin{array}{l}
d_{1} \\
d_{2} \\
d_{3}
\end{array}\right] g_{3}+\left[\begin{array}{l}
e_{1} \\
e_{2} \\
e_{3}
\end{array}\right] g_{4} \right\rvert\, a_{i}, b_{j}, c_{k},\right. \\
d_{t}, e_{s} \in R^{+} ; 1 \leq i, j, k, t, s \leq 3 ; g_{1}=(4,3,0), g_{2}=(3,0,0), \\
\left.g_{3}=(0,0,4) \text { and } g_{4}=(0,4,3), 4,3 \in Z_{6}\right\}
\end{gathered}
$$

be the special five dimensional semifield of special dual like numbers.

## Example 3.27: Let

$$
\begin{array}{r}
P=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}+a_{5} g_{4}+a_{6} g_{5}+a_{7} g_{6} \mid a_{i} \in R^{+},\right. \\
\left.1 \leq i \leq 7, g_{j} \in L ; 1 \leq j \leq 6\right\} \cup\{0\} ;
\end{array}
$$

where L is a chain lattice given below:

Clearly P is a seven dimensional semifield of special dual like numbers.

We see every distributive lattice paves way for special dual like numbers.

However modular lattices that is lattices which are not distributive, does not result in special dual like numbers on which we can define some algebraic structure on them.

Another point to be noted is lattices and Boolean algebras do not in any way help in constructing dual numbers, they are helpful only in building special dual like numbers.

We give examples of semirings and S-semirings of special dual like numbers.

Example 3.28: Let $M=\left\{\left.\left[\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+\right.$ $\mathrm{x}_{4} \mathrm{~g}_{3}$ where $\mathrm{x}_{\mathrm{j}} \in \mathrm{Q}^{+} \cup\{0\}, \mathrm{g}_{1}=(3,4,0,0), \mathrm{g}_{2}=(0,3,0,0)$, $\mathrm{g}_{3}=(3,4,0,0)$ with $3,4 \in \mathrm{Z}_{6} ; 1 \leq \mathrm{i} \leq 6$ and $\left.1 \leq \mathrm{j} \leq 3\right\}$ be the semiring of special dual like number. Clearly M is not a semifield for we see in $M$ we have elements $x, y \in M$;

$$
\mathrm{x} \times_{\mathrm{n}} \mathrm{y}=\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]=\mathrm{y} \times_{\mathrm{n}} \mathrm{x} .
$$

Consider $N=\left\{\left[\begin{array}{lll}x_{1} & x_{2} & x_{3} \\ x_{4} & x_{5} & x_{6}\end{array}\right]+\left[\begin{array}{lll}y_{1} & y_{2} & y_{3} \\ y_{4} & y_{5} & y_{6}\end{array}\right] g_{1}+\right.$

$$
\left.\left[\begin{array}{lll}
\mathrm{z}_{1} & \mathrm{z}_{2} & \mathrm{z}_{3} \\
\mathrm{z}_{4} & \mathrm{z}_{5} & \mathrm{z}_{6}
\end{array}\right] \mathrm{g}_{2}+\left[\begin{array}{ccc}
\mathrm{s}_{1} & \mathrm{~s}_{2} & \mathrm{~s}_{3} \\
\mathrm{~s}_{4} & \mathrm{~s}_{5} & \mathrm{~s}_{6}
\end{array}\right] \mathrm{g}_{3} \right\rvert\,
$$

$\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{j}}, \mathrm{z}_{\mathrm{k}}, \mathrm{s}_{\mathrm{r}} \in \mathrm{Q}^{+} \cup\{0\} ; \mathrm{g}_{1}=(3,4,0,0), \mathrm{g}_{2}=(0,3,0,0)$, $\left.\mathrm{g}_{3}=(4,0,3,4) ; 3,4 \in \mathrm{Z}_{6} ; 1 \leq \mathrm{i}, \mathrm{j}, \mathrm{k}, \mathrm{r} \leq 6\right\}$ be the special semiring of special dual like numbers.

We see M and N are isomorphic as semirings.
We define $\eta: M \rightarrow N$ as follows:
$\eta(\mathrm{A})=$

$$
\begin{aligned}
& {\left[\begin{array}{ccc}
x_{1}+y_{1} g_{1}+z_{1} g_{2}+s_{1} g_{3} & x_{2}+y_{2} g_{1}+z_{2} g_{2}+s_{2} g_{3} & x_{3}+y_{3} g_{1}+z_{3} g_{2}+s_{3} g_{3} \\
x_{4}+y_{4} g_{1}+z_{4} g_{2}+s_{4} g_{3} & x_{5}+y_{5} g_{1}+z_{5} g_{2}+s_{5} g_{3} & x_{6}+y_{6} g_{1}+z_{6} g_{2}+s_{6} g_{3}
\end{array}\right]} \\
& =\left[\begin{array}{lll}
x_{1} & x_{2} & x_{3} \\
x_{4} & x_{5} & x_{6}
\end{array}\right]+\left[\begin{array}{lll}
y_{1} & y_{2} & y_{3} \\
y_{4} & y_{5} & y_{6}
\end{array}\right] g_{1}+\left[\begin{array}{lll}
z_{1} & z_{2} & z_{3} \\
z_{4} & z_{5} & z_{6}
\end{array}\right] g_{2}+\left[\begin{array}{lll}
s_{1} & s_{2} & s_{3} \\
s_{4} & s_{5} & s_{6}
\end{array}\right] g_{3}
\end{aligned}
$$

is a one to one onto map. Infact it is easily verified $\eta$ is an isomorphisms of semirings. This result is true for any $\mathrm{m} \times \mathrm{n}$ matrix of semirings with entries from any t-dimensional special
dual like numbers. We denote by $R\left(g_{1}, g_{2}\right)=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2} \mid\right.$ $\mathrm{a}_{\mathrm{i}} \in \mathrm{R} ; 1 \leq \mathrm{i} \leq 3, \mathrm{~g}_{1}^{2}=\mathrm{g}_{1}, \mathrm{~g}_{2}^{2}=\mathrm{g}_{2}$ and $\left.\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=0\right\}$
$\mathrm{Q}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 4 ;\right.$ $\left.g_{j}^{2}=g_{j}, 1 \leq k, j \leq 3 ; g_{j} g_{k}=g_{k} g_{j}=(0)\right\}$. On similar lines we have a t -dimensional special dual like number collection which is denoted by
$R\left(g_{1}, g_{2}, \ldots, g_{t-1}\right)=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+\ldots+a_{t} g_{t-1} \mid a_{i} \in R\right.$, $1 \leq \mathrm{i} \leq \mathrm{t} ; \mathrm{g}_{\mathrm{k}}^{2}=\mathrm{g}_{\mathrm{k}}$ and $\left.\mathrm{g}_{\mathrm{j}} . \mathrm{g}_{\mathrm{k}}=(0)=\mathrm{g}_{\mathrm{k}} \mathrm{g}_{\mathrm{j}} ; 1 \leq \mathrm{j}, \mathrm{k} \leq \mathrm{t}-1\right\}$. R can be replaced by Q or Z still the results hold good. In all these cases we can say $\mathrm{R}\left(\mathrm{g}_{1}\right) \subseteq \mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right) \subseteq \mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}\right) \subseteq \ldots \subseteq$ $R\left(g_{1}, g_{2}, \ldots, g_{t-1}\right)$.

However if we replace $R$ by $\mathrm{R}^{+}$we see this chain is not possible and every element in $\mathrm{R}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{\mathrm{t}-1}\right)$ is of dimension $t$ and $t$ alone. However if $\mathrm{R}^{+}$is replaced by $\mathrm{R}^{+} \cup\{0\}$ then we see the chain relation is possible. When the chain relation is not possible the set $\mathrm{R}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{\mathrm{t}-1}\right) \cup\{0\}$ is a semifield of dimension t .

Example 3.29: Let

$$
\begin{gathered}
M=\left\{\left.\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+x_{5} g_{4}+\right. \\
x_{6} g_{5}+x_{7} g_{6}+x_{8} g_{7} \text { where } 1 \leq i \leq 4 ; x_{j} \in R^{+} ; 1 \leq j \leq 8 \text { and } \\
g_{1}=(1,0, \ldots, 0), g_{2}=(0,1,0, \ldots, 0), g_{3}=(0,0,1,0, \ldots, 0), \\
g_{4}=(0,0,0,1,0,0,0), g_{5}=(0,0,0,0,1,0,0), \\
\left.g_{6}=(0,0,0,0,0,1,0) \text { and } g_{7}=(0,0, \ldots, 0,1)\right\} \cup\left\{\left[\begin{array}{ll}
0 & 0 \\
0 & 0
\end{array}\right]\right\}
\end{gathered}
$$

be a semifield of special dual like numbers under the natural product $x_{n}$.
$N=\left\{A_{1}+A_{2} g_{1}+\ldots+A_{8} g_{7} \mid\right.$ where $A_{i} \in\left[\begin{array}{ll}x_{1} & x_{2} \\ x_{3} & x_{4}\end{array}\right] ; x_{j} \in$ $\mathrm{R}^{+} ; 1 \leq \mathrm{i} \leq 8 ; 1 \leq \mathrm{j} \leq 4 . \mathrm{g}_{1}=(1,0, \ldots, 0), \ldots, \mathrm{g}_{7}=(0,0, \ldots, 0$, $1)\} \cup\left\{\left[\begin{array}{ll}0 & 0 \\ 0 & 0\end{array}\right]\right\}$ be the semifield under $\times_{n}$ of special dual like numbers. Clearly M is isomorphic to N as semifields.

If in M and N instead of using $\mathrm{R}^{+}$if we use $\mathrm{R}^{+} \cup\{0\}$ we get semirings under natural product $\times_{\mathrm{n}}$ as well as under the usual product $\times$.

Thus we can study M or N and get the properties of both as they are isomorphic.

Example 3.30: Let

$$
S=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \left\lvert\, a_{i}=\left[\begin{array}{c}
d_{1}+d_{2} g_{1}+d_{3} g_{2}+d_{4} g_{3}+d_{5} g_{4} \\
c_{1}+c_{2} g_{1}+c_{3} g_{2}+c_{4} g_{3}+c_{5} g_{4} \\
e_{1}+e_{2} g_{1}+e_{3} g_{2}+e_{4} g_{3}+e_{5} g_{4}
\end{array}\right]\right. \text { with } d_{k}, c_{j},\right.
$$

$e_{p} \in Q^{+} \cup\{0\} 1 \leq j, k, p \leq 5$; and $g_{1}=(5,6,0) g_{2}=(0,0,5)$, $\mathrm{g}_{3}=(0,0,6), \mathrm{g}_{4}=(6,5,0)$ with $\left.6,5 \in \mathrm{Z}_{10}\right\}$ be the general semiring of five dimensional special dual like numbers. Clearly S is only a semiring and not a semifield.

$$
\begin{aligned}
& P=\left\{\sum_{i=0}^{\infty}\left[\begin{array}{c}
d_{1}^{i} \\
c_{1}^{i} \\
e_{1}^{i}
\end{array}\right] x^{i}+\sum_{i=0}^{\infty}\left[\begin{array}{c}
d_{2}^{i} \\
c_{2}^{i} \\
e_{2}^{i}
\end{array}\right] g_{1} x^{i}+\sum_{i=0}^{\infty}\left[\begin{array}{c}
d_{3}^{i} \\
c_{3}^{i} \\
e_{3}^{i}
\end{array}\right] g_{2} x^{i}+\right. \\
& \left.\sum_{i=0}^{\infty}\left[\begin{array}{l}
d_{4}^{i} \\
c_{4}^{i} \\
e_{4}^{i}
\end{array}\right] g_{3} x^{i}+\sum_{i=0}^{\infty}\left[\begin{array}{l}
d_{5}^{i} \\
c_{5}^{i} \\
e_{5}^{i}
\end{array}\right] g_{4} x^{i}\right] d_{j}^{i}, c_{t}^{i}, e_{p}^{i} \in Q^{+} \cup\{0\}, 1 \leq j \leq 5 ; \\
& 1 \leq t \leq 5,1 \leq p \leq 5 \text { with } g_{1}=(5,6,0), g_{2}=(0,0,5), \\
& \left.g_{3}=(0,0,6) \text { and } g_{4}=(6,5,0)\right\}
\end{aligned}
$$

is a general semiring of five dimension special dual like numbers and S and P are isomorphic as semirings.

Interested reader can study subsemirings, semiideals and other related properties of semirings.

We can also use lattices to get any desired dimensional special semiring of special dual like numbers. Thus lattices play a major role of getting special dual like numbers.

Further for a given lattice we get two distinct classes of general special semiring of $t$-dimensional special dual like numbers.

We will illustrate this by an example.
Example 3.31: Let L be the lattice given by the following diagram.

Clearly $a_{i} \cap a_{i}=a_{i} \cup a_{i}=a_{i}, a_{1} \cap a_{2}=a_{2}, a_{1} \cup a_{2}=a_{1}, a_{1} \cap a_{3}=$ $a_{3}, a_{1} \cup a_{3}=a_{1} a_{2} \cap a_{3}=a_{3}, a_{2} \cup a_{3}=a_{2}$.

$$
\begin{aligned}
& \text { Now let } S=\left\{x_{1}+x_{2} a_{1}+x_{3} a_{2}+x_{4} a_{3} \mid x_{i}\right. \in Q^{+} \cup\{0\} \\
&\left.1 \leq i \leq 4,1, a_{1}, a_{2}, a_{3} \in L\right\} .
\end{aligned}
$$

Consider $x=3+2 a_{1}+4 a_{2}+5 a_{3}$ and $y=8+4 a_{1}+6 a_{2}+a_{3}$ in S. $x+y=11+6 a_{1}+10 a_{2}+6 a_{3}$.

$$
\begin{aligned}
x \times y= & \left(3+2 a_{1}+4 a_{2}+5 a_{3}\right)\left(8+4 a_{1}+6 a_{2}+a_{3}\right) \\
= & 24+16 a_{1}+32 a_{2}+40 a_{3}+12 a_{1}+8 a_{1}+16 a_{2}+20 a_{3} \\
& +18 a_{2}+12 a_{2}+24 a_{2}+30 a_{3}+3 a_{3}+2 a_{3}+4 a_{3}+5 a_{3}
\end{aligned}
$$

$$
\begin{array}{r}
=24+36 \mathrm{a}_{1}+102 \mathrm{a}_{2}+104 \mathrm{a}_{3} \quad \text { (operation under } \cap \text { ) }
\end{array}
$$

$$
\begin{aligned}
\text { Now } \mathrm{x} \times \mathrm{y}= & 24+16+32+40+12+8 \mathrm{a}_{1}+16 \mathrm{a}_{1}+20 \mathrm{a}_{1}+ \\
& 18+12 \mathrm{a}_{1}+24 \mathrm{a}_{2}+30 \mathrm{a}_{2}+3+2 \mathrm{a}_{1}+4 \mathrm{a}_{2}+5 \mathrm{a}_{3} \\
= & 145+58 \mathrm{a}_{1}+58 \mathrm{a}_{2}+5 \mathrm{a}_{3} \quad \\
& \quad \text { (operation under } \cup \text { ) }
\end{aligned}
$$

Clearly I and II are not equal so for a given lattice we can get two distinct general special semiring of four dimensional special dual like numbers.

Thus lattices play a major role in building special dual like number.

We can also build matrices with lattice entries and use natural product to get special dual like numbers.

Now we proceed onto study the vector spaces and semivector spaces of t -dimensional special dual like numbers.

We also denote them by simple examples.
Example 3.32: Let $\mathrm{S}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3}+\mathrm{a}_{5} \mathrm{~g}_{4}+\mathrm{a}_{6} \mathrm{~g}_{5} \mid \mathrm{g}_{1}\right.$ $=(0,0,4), \mathrm{g}_{2}=(4,0,0), \mathrm{g}_{3}=(3,0,0), \mathrm{g}_{4}=(0,4,3)$ and $\mathrm{g}_{5}=(0$, 3,0 ) where $\left.4,3 \in Z_{6} ; a_{i} \in Q 1 \leq i \leq 6\right\}$ be a special vector space of special dual like numbers over the field Q .

We see if T is a linear operator on S then to find the eigen values associated with T .

The eigen values will be rationals. On the other hand we use the fact $\mathrm{Q}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{\mathrm{t}}\right)$ is a Smarandache ring and study the Smarandache vector space of special dual like numbers over the general S-ring of special dual like numbers, we can get dual numbers as eigen values.

We will illustrate this situation by some simple examples.

Example 3.33: Let $S=\left\{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}\right.$ where $\mathrm{g}_{1}$ and $\mathrm{g}_{2}$ are the elements of the lattice L

$\left.1 \leq i \leq 4 ; x_{j} \in Q ; 1 \leq j \leq 3\right\}$ be the Smarandache special vector space of special dual like numbers over the Smarandache ring.

$$
\begin{gathered}
\mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 3 ; \mathrm{g}_{1}^{2}=\mathrm{g}_{1},\right. \\
\left.\mathrm{g}_{1} \cap \mathrm{~g}_{2}=\mathrm{g}_{2} \cap \mathrm{~g}_{1}=0 \text { and } \mathrm{g}_{2}^{2}=\mathrm{g}_{2} ; \mathrm{g}_{1}, \mathrm{~g}_{2} \in \mathrm{~L}\right\} .
\end{gathered}
$$

Clearly eigen values of any linear operator can also be special dual like numbers. So by using the Smarandache vector spaces of special dual like numbers we can get the eigen values to be special dual like numbers. This is one of the advantages of using S-vector spaces over S-rings which are general special dual like rings.

Example 3.34: Let $S=\left\{\left(a_{1}, a_{2}, a_{3}, a_{4}\right)\right.$ where $a_{i}=x_{1}+x_{2} g_{1}+$ $\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{5}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{R} ; \mathrm{g}_{\mathrm{j}} \in \mathrm{L}$ where L

$1 \leq \mathrm{j} \leq 6,1 \leq \mathrm{i} \leq 7\}$ be a S-vector space of special dual like numbers over the S ring
$R\left(g_{1}, g_{2}, \mathrm{~g}_{3}, \mathrm{~g}_{4}, \mathrm{~g}_{5}, \mathrm{~g}_{6}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\ldots+\mathrm{x}_{7} \mathrm{~g}_{6} \mid \mathrm{g}_{\mathrm{i}} \in \mathrm{L}\right.$; $\left.1 \leq \mathrm{i} \leq 6, \mathrm{x}_{\mathrm{j}} \in \mathrm{R} ; 1 \leq \mathrm{j} \leq 7\right\}$ of special dual like numbers. If T is a linear operator on $S$ then the eigen values related with $T$ can be specal dual like numbers from $R\left(g_{1}, g_{2}, \ldots, g_{6}\right)$.

Similarly the eigen vectors related with any linear operator can be special dual like numbers.

Now we proceed onto study linear functional of a vector space of special dual like numbers and S-vector space of special dual like numbers.

Example 3.35: Let $V=\left\{\left.\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3} \\ a_{4}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+\right.$
$\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5} ; \mathrm{g}_{\mathrm{j}} \in \mathrm{L}$ where L is a lattice given by

$\left.1 \leq \mathrm{j} \leq 5, \mathrm{x}_{\mathrm{i}} \in \mathrm{Q}, 1 \leq \mathrm{i} \leq 6\right\}$ be a S-vector space of special dual like numbers over the S-ring, $\mathrm{Q}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}, \mathrm{~g}_{4}, \mathrm{~g}_{5}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\right.$ $\left.\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 6 ; \mathrm{g}_{\mathrm{j}} \in \mathrm{L} ; 1 \leq \mathrm{j} \leq 5\right\}$

Example 3.36: Let $\mathrm{V}=\left\{\left.\left[\begin{array}{llll}\mathrm{a}_{1} & \mathrm{a}_{2} & \mathrm{a}_{3} & \mathrm{a}_{7} \\ \mathrm{a}_{4} & \mathrm{a}_{5} & \mathrm{a}_{6} & \mathrm{a}_{8}\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\right.$ $\mathrm{x}_{3} \mathrm{~g}_{2} ; 1 \leq \mathrm{i} \leq 8, \mathrm{x}_{\mathrm{j}} \in \mathrm{R} ; 1 \leq \mathrm{j} \leq 3, \mathrm{~g}_{1}, \mathrm{~g}_{2} \in \mathrm{~L} ;$

be the S-vector space of special dual like numbers over the S$\operatorname{ring} \mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2} ; \mathrm{x}_{\mathrm{i}} \in \mathrm{R} ; \mathrm{g}_{1}, \mathrm{~g}_{2} \in \mathrm{~L}, 1 \leq \mathrm{i} \leq 3\right\}$.

We see $V$ is a S-linear algebra under the natural product $\times_{n}$ over the S-ring, $\mathrm{R}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ and for any S-linear operator on V we can have the eigen vectors to be special dual like numbers.

Now having seen examples of S-linear algebras, S-linear operators T and eigen vectors associated with T are special dual like numbers we proceed onto give examples of special ndimensional semivector spaces / semilinear algebras of special dual like numbers and strong special n-dimensional semivector spaces / semilinear algebras of special dual like numbers.

Example 3.37: Let $\mathrm{S}=\left\{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4}\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}\right.$ $+\mathrm{x}_{5} \mathrm{~g}_{4}, 1 \leq \mathrm{i} \leq 4, \mathrm{x}_{\mathrm{j}} \in \mathrm{R}^{+} \cup\{0\} ; 1 \leq \mathrm{j} \leq 5$ and $\mathrm{g}_{\mathrm{p}} \in \mathrm{L}$ where

$1 \leq p \leq 4\}$ be the semivector space of special dual like numbers over the semifield $\mathrm{R}^{+} \cup\{0\}$. The eigen values of S associated with any linear operator is real and the eigen vectors are from $\left(\mathrm{R}^{+} \cup\{0\}\right)\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}, \mathrm{~g}_{4}\right)$.

Example 3.38: Let $S=\left\{\left.\left[\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9} \\ a_{10} & a_{11} & a_{12} \\ a_{13} & a_{14} & a_{15} \\ a_{16} & a_{17} & a_{18}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}\right.$
$+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}$, with $\mathrm{x}_{\mathrm{k}} \in \mathrm{Q}^{+} \cup\{0\} ; \mathrm{g}_{\mathrm{j}} \in \mathrm{L}$ where

$1 \leq \mathrm{i} \leq 18,1 \leq \mathrm{k} \leq 5$ and $1 \leq \mathrm{j} \leq 4\}$ be the strong semivector space of special dual like numbers over the semifield $\mathrm{R}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right.$, $\left.\mathrm{g}_{3}, \mathrm{~g}_{4}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4} \mid \mathrm{g}_{\mathrm{j}} \in \mathrm{L}, 1 \leq \mathrm{j} \leq 4, \mathrm{x}_{\mathrm{i}} \in\right.$ $\left.\mathrm{R}^{+}, 1 \leq \mathrm{i} \leq 5\right\} \cup\{0\}$. The eigen values of S related with any linear operator on T can be special dual like numbers.

Example 3.39: Let

$$
\begin{gathered}
P=\left\{\left.\left[\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{10} \\
a_{11} & a_{12} & \ldots & a_{20}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+\right. \\
x_{5} g_{4} ; 1 \leq i \leq 20, x_{j} \in Q^{+} \cup\{0\} ; 1 \leq j \leq 5 \text { and } g_{i} \in L ;
\end{gathered}
$$

$\left.\mathrm{g}_{\mathrm{k}} \in \mathrm{L} ; 1 \leq \mathrm{k} \leq 4\right\}$ be a strong semivector space over the semifield $\mathrm{Q}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}, \mathrm{~g}_{4}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}, \mathrm{x}_{\mathrm{i}} \in\right.$ $\left.\left.\mathrm{Q}^{+}, 1 \leq \mathrm{i} \leq 5\right\}, \mathrm{g}_{\mathrm{j}} \in \mathrm{L} ; 1 \leq \mathrm{j} \leq 4\right\} \cup\{0\}$.

Any linear operator T has its associated eigen values to be special dual like numbers.

Further if $\mathrm{f}: \mathrm{P} \rightarrow \mathrm{Q}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}, \mathrm{~g}_{4}\right) \cup\{0\}$; then f also has for any $A \in P ; f(A)$ to be a special dual like numbers.

Finally we give examples of them.

Example 3.40: Let $\mathrm{M}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2} ; 1 \leq \mathrm{i}\right.$ $\leq 3 \mathrm{x}_{\mathrm{j}} \in \mathrm{Q}^{+} \cup\{0\} ; 1 \leq \mathrm{j} \leq 3$;

be a strong semivector space over the semifield
$\mathrm{Q}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right) \cup\{0\}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}\right\} \cup\{0\}$ where $\mathrm{x}_{\mathrm{i}} \in \mathrm{Q}^{+}$ and $\mathrm{g}_{\mathrm{j}} \in \mathrm{L}, \mathrm{l} \leq \mathrm{i} \leq 3$ and $1 \leq \mathrm{j} \leq 2$.

Define $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{Q}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right) \cup\{0\}$ as

$$
\begin{aligned}
& \mathrm{f}\left(\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}\right)\right)=\mathrm{f}\left(\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}, \mathrm{y}_{1}+\mathrm{y}_{2} \mathrm{~g}_{1}+\mathrm{y}_{3} \mathrm{~g}_{2}, \mathrm{z}_{1}+\mathrm{z}_{2} \mathrm{~g}_{1}+\mathrm{z}_{3} \mathrm{~g}_{2}\right) \\
& \quad=\mathrm{x}_{1}+\mathrm{y}_{1}+\mathrm{z}_{1}+\left(\mathrm{x}_{2}+\mathrm{y}_{2}+\mathrm{z}_{2}\right) \mathrm{g}_{1}+\left(\mathrm{x}_{3}+\mathrm{y}_{3}+\mathrm{z}_{3}\right) \mathrm{g}_{2} \in \mathrm{Q}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right) \cup \\
& \{0\} \text { if } \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{j}}, \mathrm{z}_{\mathrm{k}} \in \mathrm{Q}^{+} ; 1 \leq \mathrm{i}, \mathrm{j}, \mathrm{k} \leq 3 \text { and } 0 \text { if even one of } \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{j}} \text { or } \\
& \mathrm{z}_{\mathrm{k}} \text { is zero. }
\end{aligned}
$$

f is a semilinear functional on M .

Example 3.41: Let $S=\left\{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}\right.$; $1 \leq \mathrm{i} \leq 4, \mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3} \in \mathrm{Z}_{7} ;$

be the special vector space of special dual like numbers.

$$
\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6} ; 1 \leq \mathrm{i} \leq 6
$$

$\left.\mathrm{x}_{\mathrm{k}} \in \mathrm{Z}_{11} ; 1 \leq \mathrm{k} \leq 7\right\}$ be the special vector space of special dual like numbers over the field $\mathrm{Z}_{11}$.

Define $f: S \rightarrow Z_{11}$ by $f\left(\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3} \\ a_{4} \\ a_{5} \\ a_{6}\end{array}\right]\right)=x_{1}+y_{1}+z_{1}+d_{1}+e_{1}+f_{1}$ $(\bmod 11) ;$
where

$$
\begin{aligned}
& \mathrm{a}_{1}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{7} \mathrm{~g}_{6} \\
& \mathrm{a}_{2}=\mathrm{y}_{1}+\mathrm{y}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{y}_{7} \mathrm{~g}_{6} \\
& \mathrm{a}_{3}=\mathrm{z}_{1}+\mathrm{z}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{z}_{7} \mathrm{~g}_{6} \\
& \mathrm{a}_{4}=\mathrm{d}_{1}+\mathrm{d}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{d}_{7} \mathrm{~g}_{6} \\
& \mathrm{a}_{5}=\mathrm{e}_{1}+\mathrm{e}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{e}_{7} \mathrm{~g}_{6} \\
& \mathrm{a}_{6}=\mathrm{f}_{1}+\mathrm{f}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{f}_{7} \mathrm{~g}_{6} ;
\end{aligned}
$$

$f$ is a linear functional on $S$.
Example 3.43: Let $S=\left\{\left.\left[\begin{array}{cccc}a_{1} & a_{2} & \ldots & a_{10} \\ a_{11} & a_{12} & \ldots & a_{20} \\ a_{21} & a_{22} & \ldots & a_{30}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}\right.$
$+\ldots+\mathrm{x}_{7} \mathrm{~g}_{6} ; 1 \leq \mathrm{i} \leq 30, \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{37} ; 1 \leq \mathrm{j} \leq 7$

$1 \leq \mathrm{k} \leq 6\}$ be special vector space of dual like numbers over the field $Z_{37}$. Clearly $S$ has only finite number of elements. If $T$ is any linear operator then the eigen vector associated with T are special dual like numbers.

Example 3.44: Let $\mathrm{M}=\left\{\begin{array}{cc}{\left.\left[\begin{array}{cc}\mathrm{a}_{1} & \mathrm{a}_{2} \\ 0 & \mathrm{a}_{3}\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3},}\end{array}\right.$ $+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}$ where $1 \leq \mathrm{i} \leq 3, \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{5} ; 1 \leq \mathrm{j} \leq 6$

$1 \leq \mathrm{k} \leq 5\}$ be a special vector space of special dual like numbers over the field $\mathrm{Z}_{5}$.
$M$ is also finite dimensional; $M$ under the natural product $\times_{n}$ is a special linear algebra of special dual like numbers over $\mathrm{Z}_{5}$.

Now we give example Smarandache special vector spaces / linear algebras of special dual like numbers over the S-ring $Z_{p}\left(g_{1}, g_{2}, \ldots, g_{t}\right)$; where $Z_{p}\left(g_{1}, g_{2}, \ldots, g_{t}\right)=\left\{x_{1}+x_{2} g_{1}+\ldots+\right.$ $\mathrm{x}_{\mathrm{t}+1} \mathrm{~g}_{\mathrm{t}} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}_{\mathrm{p}} ; 1 \leq \mathrm{i} \leq \mathrm{t}+1$ and $\mathrm{g}_{\mathrm{j}} \in \mathrm{L} ; \mathrm{L}$ is distributive lattice, $1 \leq \mathrm{j} \leq \mathrm{t} ; \mathrm{p}$ a prime $\}$.

We give a few examples. The main property enjoyed by these Smarandache vector spaces are that they have finite number of elements in them and the eigen values can be special dual like numbers from $Z_{p}\left(g_{1}, \ldots, g_{t}\right)$.

We will illustrate this situation by some examples.

Example 3.45: Let $\mathrm{S}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}\right.$ where $1 \leq \mathrm{i} \leq 3 ; \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{3}, 1 \leq \mathrm{j} \leq 3$ and

be a Smarandache special vector space of special dual like numbers over the S-ring

$$
\mathrm{Z}_{3}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2} \mid \mathrm{g}_{1}, \mathrm{~g}_{2} \in \mathrm{~L}, \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}_{3} 1 \leq \mathrm{i} \leq 3\right\} .
$$

Clearly the eigen values in general of T of $\mathrm{S}(\mathrm{T}: \mathrm{S} \rightarrow \mathrm{S})$ can also be special dual like numbers from $Z_{3}\left(g_{1}, g_{2}\right)$.

$\mathrm{x}_{7} \mathrm{~g}_{6} ; 1 \leq \mathrm{i} \leq 10, \mathrm{~g}_{\mathrm{j}} \in \mathrm{L}, 1 \leq \mathrm{j} \leq 6$ and $\mathrm{x}_{\mathrm{k}} \in \mathrm{Z}_{7} ; 1 \leq \mathrm{k} \leq 7$, where

be the Smarandache special dual like number vector space over the S -ring $\mathrm{Z}_{7}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{6}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{7} \mathrm{~g}_{6} \mid \mathrm{g}_{\mathrm{i}} \in \mathrm{L}\right.$, $1 \leq \mathrm{i} \leq 6$ and $\left.\mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{7} ; 1 \leq \mathrm{j} \leq 7\right\}$.

Clearly $\mathrm{Z}_{7} \subseteq \mathrm{Z}_{7}\left(\mathrm{~g}_{1}\right) \subseteq \mathrm{Z}_{7}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right) \subseteq \mathrm{Z}_{7}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}\right) \subseteq \ldots \subseteq$ $\mathrm{Z}_{7}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{6}\right)$.

All $\mathrm{Z}_{7}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{\mathrm{t}}\right) ; 1 \leq \mathrm{t} \leq 6$ is also a S -ring for $\mathrm{Z}_{7}$; the field is properly contained in them.

The eigen values related with a linear operator T on S can also be a special dual like number.

Example 3.47: Let $S=\left\{\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9}\end{array}\right]$ where $a_{i}=x_{1}+x_{2} g_{1}$ $+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}$ where $\mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{13}, 1 \leq \mathrm{j} \leq 6 ; 1 \leq \mathrm{i} \leq 9$ and

$1 \leq \mathrm{k} \leq 5\}$ be is Smarandache special vector space of special dual like numbers over the S-ring; $\mathrm{Z}_{13}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{4}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\right.$ $\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{4}$ where the operation on $\mathrm{g}_{\mathrm{j}}$ 's are intersection and $\mathrm{g}_{1}$, $g_{2}, g_{4}$ are in $\left.L ; x_{j} \in Z_{13}, 1 \leq j \leq 4\right\}$, Here also for any linear operator on $S$ we can have the eigen values to be special dual like numbers from $\mathrm{Z}_{13}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{4}\right)$.

Finally we give examples of polynomial special dual like number vector spaces.

Example 3.48: Let $S=\left\{\left.\left[\begin{array}{llll}a_{1} & a_{2} & \ldots & a_{8} \\ a_{9} & a_{10} & \ldots & a_{16} \\ a_{17} & a_{18} & \ldots & a_{24}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}\right.$ $+\ldots+\mathrm{x}_{7} \mathrm{~g}_{6} ;$ with $\mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{11} ; 1 \leq \mathrm{j} \leq 7,1 \leq \mathrm{i} \leq 24$ and $\mathrm{g}_{\mathrm{k}} \in \mathrm{L}$;

$1 \leq \mathrm{k} \leq 6\}$ be a special vector space of special dual like numbers over the field $\mathrm{Z}_{11}$.

The eigen values of any linear operator on S has only elements from $Z_{11}$, however the eigen vectors of $T$ can be special dual like numbers.

However if $S$ is defined over the S -ring, $\mathrm{Z}_{11}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{6}\right)$ with $g_{i} \in L$ then $S$ is a Smarandache special vector space over the S-ring, $\mathrm{Z}_{11}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{6}\right)$ and the eigen values associated with a linear operator on S can be special dual like numbers.

Thus we see the possibility of getting eigen values of special dual like numbers will certainly find nice applications. Finally we give examples of Smarandache vector spaces / linear algebras over the S-ring of special dual like number where the S-rings are $Z_{n}\left(g_{1}, \ldots, g_{t}\right) ; \mathrm{n}$ not a prime but a composite number.

Example 3.49: Let $\left.\mathrm{V}=\left\{\begin{array}{ll}\mathrm{a}_{1} & \mathrm{a}_{2} \\ \mathrm{a}_{3} & \mathrm{a}_{4}\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}$ with $\mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{12} ; 1 \leq \mathrm{i} \leq 4 ; 1 \leq \mathrm{j} \leq 3$ and $\mathrm{g}_{1}, \mathrm{~g}_{2} \in \mathrm{~L}=$

be the strong Smarandache special dual like number vector space over the S -ring

$$
\mathrm{Z}_{12}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}_{12} ; \mathrm{g}_{1}, \mathrm{~g}_{2} \in \mathrm{~L} ; 1 \leq \mathrm{i} \leq 3\right\}
$$

Example 3.50: Let

$$
M=\left\{\left.\left[\begin{array}{llll}
a_{1} & a_{2} & \ldots & a_{10} \\
a_{11} & a_{12} & \ldots & a_{20}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+\right.
$$

$$
\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6} \text { with } 1 \leq \mathrm{i} \leq 20 \text { and } \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{24}
$$

$1 \leq \mathrm{j} \leq 7$ and

$1 \leq \mathrm{p} \leq 6\}$ be the Smarandache special vector space of special dual like numbers over the S -ring $\mathrm{Z}_{24}$. Clearly M is not a strong Smarandache vector space over a S-ring.

Example 3.51: Let $\mathrm{P}=\left\{\begin{array}{c}{\left.\left[\begin{array}{c}a_{1} \\ a_{2} \\ a_{3} \\ \vdots \\ a_{16}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+} \\ \end{array}\right.$ $\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}+\mathrm{x}_{8} \mathrm{~g}_{7}$ with $1 \leq \mathrm{i} \leq 16 ; \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{30}, 1 \leq \mathrm{j} \leq 8$ and

$1 \leq \mathrm{p} \leq 7\}$ be a strong Smarandache special dual like number vector space over the S-ring.
$\mathrm{Z}_{30}\left(\mathrm{~g}_{1}, \ldots, \mathrm{~g}_{7}\right)=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{8} \mathrm{~g}_{7} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}_{30}, 1 \leq \mathrm{i} \leq 8\right.$ and $\left.\mathrm{g}_{\mathrm{j}} \in \mathrm{L} ; 1 \leq \mathrm{j} \leq 7\right\}$.

This P has eigen vaues which can be special dual like numbers for any associated linear operator T of P. Also T can have eigen vectors which can be special dual like numbers.

Study of these properties using strong Smarandache special dual like numbers using $Z_{n}\left(g_{1}, \ldots, g_{t}\right)$ can lead to several applications and the $\mathrm{S}-\mathrm{ring} \mathrm{Z}_{\mathrm{n}}\left(\mathrm{g}_{1}, \ldots, \mathrm{~g}_{\mathrm{t}}\right)$ can be so chosen that $\mathrm{Z}_{\mathrm{n}}\left(\mathrm{g}_{1}, \ldots, \mathrm{~g}_{\mathrm{t}}\right)$ contains a field as a subset of desired quality.

## Chapter Four

## Special DuAl like Neutrosophic Numbers

The concept of neutrosophy and the indeterminate I, was introduced and studied by in [11].

Recently in 2006 neutrosophic rings was introduced and studied [23]. In this chapter we study the notion of neutrosophic special dual like numbers.

Consider $\mathrm{S}=\langle\mathrm{Q} \cup \mathrm{I}\rangle=\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Q}\} ; \mathrm{S}$ is a ring S is a general special dual like number ring.

Suppose $T=\langle R \cup I\rangle=\left\{a+b I \mid a, b \in R, I^{2}=I\right\} ; T$ is a general neutrosophic ring of special dual like numbers.

Let $\mathrm{F}=\langle\mathrm{Z} \cup \mathrm{I}\rangle=\left\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z} ; \mathrm{I}^{2}=\mathrm{I}\right\} ; \mathrm{F}$ is a general neutrosophic ring of special dual like numbers.

Like $\mathrm{S}=\left\langle\mathrm{Z}_{\mathrm{n}} \cup \mathrm{I}\right\rangle=\left\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}_{\mathrm{n}}, \mathrm{I}^{2}=\mathrm{I}\right\}$ is a general neutrosophic ring of special dual like numbers.

Example 4.1: Let $\mathrm{S}=\left\{\left\langle\mathrm{Z}_{12} \cup \mathrm{I}\right\rangle\right\}=\left\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}_{12}, \mathrm{I}^{2}=\mathrm{I}\right\}$ be the general neutrosophic ring of special dual like numbers of finite order.

Example 4.2: Let $\mathrm{T}=\{\langle 5 \mathrm{Z} \cup \mathrm{I}\rangle\}=\left\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in 5 \mathrm{Z}, \mathrm{I}^{2}=\mathrm{I}\right\}$ be the general neutrosophic ring of special dual like numbers of infinite order.

Example 4.3: Let $\mathrm{M}=\{\langle\mathrm{R} \cup \mathrm{I}\rangle\}=\left\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in \mathrm{R}, \mathrm{I}^{2}=\mathrm{I}\right\}$ be the general neutrosophic ring of special dual like numbers.

Example 4.4: Let $\mathrm{M}=\left\{\left\langle\mathrm{Z}_{39} \cup \mathrm{I}\right\rangle\right\}=\left\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}_{39}, \mathrm{I}^{2}=\mathrm{I}\right\}$ be the general neutrosophic ring of special dual like numbers.

Clearly we have to use the term only general ring as M contains $Z_{39}$ as a subring as well as $Z_{39} I \subseteq M$ as a neutrosophic subring which is also an ideal, that is every element is not of the form $\mathrm{a}+\mathrm{bI}$, both a and b not zero.

A ring which has special dual like numbers as well as other elements will be known as the general neutrosophic ring of special dual like numbers.

Example 4.5: Let $\mathrm{S}=\left\{\left\langle\mathrm{Z}_{5} \cup \mathrm{I}\right\rangle\right\}=\left\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}_{5}, \mathrm{I}^{2}=\mathrm{I}\right\}$ be the general neutrosophic ring of special dual like numbers of dimension two. Clearly S is a Smarandache ring. $\mathrm{Z}_{5} \mathrm{I} \subseteq \mathrm{S}$ is an ideal of $\mathrm{S} . \mathrm{Z}_{5} \subseteq \mathrm{~S}$ is only a subring of S which is not an ideal. Clearly $S$ is a finite ring characteristic five.

Example 4.6: $\mathrm{S}=\{\langle\mathrm{Z} \cup \mathrm{I}\rangle\}=\left\{\mathrm{a}+\mathrm{bI} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}, \mathrm{I}^{2}=\mathrm{I}\right\}$ be the general neutrosophic ring of special dual like numbers.

S has ideals and subrings which are not ideals. Clearly S is of infinite order and of dimension two.

Now we build matrices and polynomials using general neutrosophic ring of special ring of special dual like numbers.

$$
\text { Consider } A=\left\{\left.\left(\begin{array}{ll}
x_{1} & x_{2} \\
x_{3} & x_{4}
\end{array}\right) \right\rvert\, x_{i} \in\langle Z \cup I\rangle ; i=1,2,3,4\right\} ;
$$

A is a non commutative general neutrosophic matrix ring of special dual like numbers under the usual product $\times$.

Infact A has zero divisors, units, idempotents, ideals and subrings which are not ideals.

If on $A$ we define the natural product $\times_{n}$ then $A$ is a commutative neutrosophic with zero divisors, units and ideals.

$$
\text { For }\left[\begin{array}{ll}
0 & x_{1} \\
0 & x_{2}
\end{array}\right] \times\left[\begin{array}{ll}
x_{1} & 0 \\
x_{2} & 0
\end{array}\right]=\left[\begin{array}{ll}
0 & 0 \\
0 & 0
\end{array}\right] x_{i} \in\langle Z \cup I\rangle ; 1 \leq i \leq 2
$$

We can have general neutrosophic row matrix ring of special dual like numbers.

Consider
$\mathrm{B}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{10}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{a}+\mathrm{bI}\right.$ with $\mathrm{a}, \mathrm{b} \in \mathrm{Q}$ and $\left.\mathrm{I}^{2}=\mathrm{I} ; 1 \leq \mathrm{i} \leq 10\right\} ;$ $B$ is a general neutrosophic row matrix ring of special dual like numbers. B has zero divisors, units and idempotents.

$$
\text { Let } C=\left\{\left.\left[\begin{array}{c}
a_{1} \\
a_{2} \\
\vdots \\
a_{n}
\end{array}\right] \right\rvert\, a_{i} \in\langle Q \cup I\rangle ; 1 \leq i \leq n\right\} ; C \text { is a general }
$$

neutrosophic column matrix ring of special dual like numbers under the natural product $\times_{n}$.

$$
\text { If } x=\left[\begin{array}{c}
I \\
0 \\
0 \\
\vdots \\
I \\
I
\end{array}\right] \in C \text { we see } x^{2}=x \text { and so on. }
$$

However we cannot define usual product $\times$ on $C$.

Finally consider

$$
\begin{array}{r}
P=\left\{\begin{aligned}
&\left\{\left.\left[\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{15} \\
a_{16} & a_{17} & \ldots & a_{30} \\
a_{31} & a_{32} & \ldots & a_{45} \\
a_{41} & a_{47} & \ldots & a_{60}
\end{array}\right] \right\rvert\,\right. a_{i}=x+y I \in\langle R \cup I\rangle ; \\
&\left.x, y \in R ; I^{2}=I \quad 1 \leq i \leq 6\right\} ;
\end{aligned}\right. \\
x,
\end{array}
$$

P is a general neutrosophic $4 \times 15$ matrix ring of special dual like numbers under the natural product $\times_{n}$.
$P$ has zero divisors, units and idempotents.
Further

$$
\mathrm{I}_{4 \times 15}=\left[\begin{array}{cccc}
1 & 1 & \ldots & 1 \\
1 & 1 & \ldots & 1 \\
1 & 1 & \ldots & 1 \\
1 & 1 & \ldots & 1
\end{array}\right]
$$

is the unit (i.e., the identity element of P with respect to the natural product $\times_{n}$.

Now we will give more examples of this situation.

Example 4.7: Let

$$
S=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i} \in\left\langle Z_{6} \cup I\right\rangle ; 1 \leq i \leq 9 ; I^{2}=I\right\}
$$

be the general neutrosophic square matrix ring of special dual like numbers.

$$
\left[\begin{array}{lll}
1 & 1 & 1 \\
1 & 1 & 1 \\
1 & 1 & 1
\end{array}\right] \text { is the identity with respect to natural product } \times_{n} \text {. }
$$

If on $S$ we define the usual product $\times$ then $S$ has $\left[\begin{array}{lll}1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1\end{array}\right]$ to be the unit. $\left(\mathrm{S},+, x_{\mathrm{n}}\right)$ is a commutative ring where as $(\mathrm{S},+, \times)$ is a non commutative ring.

S has units, zero divisors, ideals and subrings which are not ideals. Further S has only finite number of elements in it.

$$
X=\left[\begin{array}{lll}
\mathrm{I} & 0 & 0 \\
\mathrm{I} & \mathrm{I} & 0 \\
0 & \mathrm{I} & \mathrm{I}
\end{array}\right] \text { is an idempotent under natural product } \times_{\mathrm{n}}
$$

and X is not an idempotent under the usual product $\times$.
Example 4.8: Let

$$
P=\left\{\left.\left[\begin{array}{cc}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
\vdots & \vdots \\
a_{15} & a_{16}
\end{array}\right] \right\rvert\, a_{i} \in\left\langle Z_{3} \cup I\right\rangle ; 1 \leq i \leq 16\right\}
$$

be the general neutrosophic matrix ring of special dual like numbers under the natural product $x_{n}$. $P$ has zero divisors, units, idempotents, ideal and subrings which are not ideals.

$$
\begin{aligned}
\mathrm{x} & =\left[\begin{array}{cc}
1 & 1 \\
1 & 1 \\
1 & 1 \\
\vdots & \vdots \\
1 & 1
\end{array}\right] \text { is the unit, } \mathrm{y}=\left[\begin{array}{cc}
0 & \mathrm{I} \\
1 & 0 \\
0 & \mathrm{I} \\
\vdots & \vdots \\
\mathrm{I} & 0
\end{array}\right] \text { is an idempotent. } \\
\mathrm{M} & =\left\{\begin{array}{cc}
\left.\left.\left[\begin{array}{cc}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
0 & 0 \\
\vdots & \vdots \\
0 & 0
\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}} \in\left\langle\mathrm{Z}_{3} \cup \mathrm{I}\right\rangle ; 1 \leq \mathrm{i} \leq 4\right\} \subseteq \mathrm{P}
\end{array}\right.
\end{aligned}
$$

is a subring as well as ideal of P .

$$
\mathrm{x}=\left[\begin{array}{cc}
\mathrm{a}_{1} & 0 \\
\mathrm{a}_{2} & 0 \\
\vdots & \vdots \\
\mathrm{a}_{16} & 0
\end{array}\right] \text { and } \mathrm{y}=\left[\begin{array}{cc}
0 & \mathrm{~b}_{1} \\
0 & \mathrm{~b}_{2} \\
\vdots & \vdots \\
0 & \mathrm{~b}_{16}
\end{array}\right]
$$

in $P$ are such that $x x_{n} y=\left[\begin{array}{cc}0 & 0 \\ 0 & 0 \\ \vdots & \vdots \\ 0 & 0\end{array}\right]$ is a zero divisor in $P$.
$P$ has only finite number of elements in it.

Example 4.9: Let

$$
S=\left\{\left.\left[\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{5} \\
a_{6} & a_{7} & \ldots & a_{10}
\end{array}\right] \right\rvert\, a_{i} \in\langle R \cup I\rangle ; 1 \leq i \leq 10\right\}
$$

be the general neutrosophic $2 \times 5$ matrix ring of special dual like numbers under the natural product $x_{n}$. $S$ is of infinite order.

$$
\mathrm{P}=\left\{\left.\left[\begin{array}{llll}
\mathrm{a}_{1} & \mathrm{a}_{2} & \ldots & \mathrm{a}_{5} \\
\mathrm{a}_{6} & \mathrm{a}_{7} & \ldots & \mathrm{a}_{10}
\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}} \in\langle\mathrm{Z} \cup \mathrm{I}\rangle ; 1 \leq \mathrm{i} \leq 10\right\} \subseteq \mathrm{S}
$$

is only a subring which is not an ideal of S .
S has zero divisors, units, idempotents.
Clearly $\left[\begin{array}{lllll}1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1\end{array}\right] \in S$ is the unit in $S$.

$$
\begin{aligned}
& {\left[\begin{array}{lllll}
\mathrm{I} & \mathrm{I} & \mathrm{I} & \mathrm{I} & \mathrm{I} \\
\mathrm{I} & \mathrm{I} & \mathrm{I} & \mathrm{I} & \mathrm{I}
\end{array}\right] \text { in } \mathrm{S} \text { is an idempotent; }} \\
& \mathrm{y}=\left[\begin{array}{lllll}
\mathrm{I} & 0 & 1 & \mathrm{I} & 0 \\
0 & \mathrm{I} & 1 & \mathrm{I} & \mathrm{I}
\end{array}\right] \in \mathrm{S} \text { is also an idempotent of } \mathrm{S} .
\end{aligned}
$$

Example 4.10: Let

$$
P=\left\{\left.\left[\begin{array}{ccc}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9} \\
a_{10} & a_{11} & a_{12}
\end{array}\right] \right\rvert\, a_{i} \in\left\langle Z_{4} \cup I\right\rangle ; 1 \leq i \leq 12\right\}
$$

be the general $4 \times 3$ matrix neutrosophic special dual like number ring of finite order. P is commutative. P has units, idempotents, and zero divisors.

$$
\mathrm{I}_{4 \times 3}=\left[\begin{array}{lll}
1 & 1 & 1 \\
1 & 1 & 1 \\
1 & 1 & 1 \\
1 & 1 & 1
\end{array}\right] \in \mathrm{P} \text { is the unit of } \mathrm{P}
$$

Now we proceed onto study neutrosophic general polynomial ring of special dual like elements of dimension two.

## Example 4.11: Let

$$
\mathrm{P}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in\langle\mathrm{Z} \cup \mathrm{I}\rangle ; \mathrm{I}^{2}=\mathrm{I}\right\}
$$

be the general neutrosophic polynomial ring of special dual like numbers. P has ideals and subrings which are not ideals.

Example 4.12: Let

$$
\mathrm{S}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in\left\langle\mathrm{Z}_{8} \cup \mathrm{I}\right\rangle ; \mathrm{I}^{2}=\mathrm{I}\right\}
$$

be the general neutrosophic polynomial ring of special dual like numbers. S has zero divisors and ideals.

## Example 4.13: Let

$$
S=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{i} \in\langle R \cup I\rangle ; I^{2}=I\right\}
$$

be the general neutrosophic polynomial ring of special dual like numbers. S has subrings which are not ideals.

For take

$$
\mathrm{P}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in\langle\mathrm{Z} \cup \mathrm{I}\rangle ; \mathrm{I}^{2}=\mathrm{I}\right\} \subseteq \mathrm{S}
$$

$P$ is only a subring of $S$ and is not an ideal of $S$.

## Example 4.14: Let

$$
\mathrm{S}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in\left\langle\mathrm{Z}_{7} \cup \mathrm{I}\right\rangle\right\}
$$

be the general neutrosophic polynomial ring of special dual like numbers.

## Example 4.15: Let

$$
\mathrm{S}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in\langle\mathrm{R} \cup \mathrm{I}\rangle ; \mathrm{I}^{2}=\mathrm{I}\right\}
$$

be the general neutrosophic polynomial of special dual like numbers can S have irreducible polynomials.

Now having seen polynomial general neutrosophic ring of special dual like numbers, we now proceed onto give a different representation for the general ring of matrix neutrosophic special dual like numbers.

Example 4.16: Let
$\mathrm{M}=\left\{\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right)+\left(\mathrm{y}_{1}, \mathrm{y}_{2}, \mathrm{y}_{3}\right) \mathrm{I} \mid \mathrm{I}^{2}=\mathrm{I}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{j}} \in \mathrm{R} ; 1 \leq \mathrm{i}, \mathrm{j} \leq 3\right\}$ be the neutrosophic general ring of special dual like numbers.

Consider $\mathrm{N}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}\right) \mid \mathrm{a}_{1}=\mathrm{x}_{1}+\mathrm{y}_{1} \mathrm{I} ; \mathrm{a}_{2}=\mathrm{x}_{2}+\mathrm{y}_{2} \mathrm{I}\right.$ and $\mathrm{a}_{3}$ $\left.=\mathrm{x}_{3}+\mathrm{y}_{3} \mathrm{I}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{j}} \in \mathrm{R} ; 1 \leq \mathrm{i}, \mathrm{j} \leq 3, \mathrm{I}^{2}=\mathrm{I}\right\} ; \mathrm{N}$ is also a neutrosophic general ring of special dual like numbers.

Clearly N and M are isomorphic as rings, for define $\eta: M \rightarrow N$ by $\eta\left(\left(x_{1}, x_{2}, x_{3}\right)+\left(y_{1}, y_{2}, y_{3}\right) I\right)$

$$
=\left(\mathrm{x}_{1}+\mathrm{y}_{1} \mathrm{I}, \mathrm{x}_{2}+\mathrm{y}_{2} \mathrm{I}, \mathrm{x}_{3}+\mathrm{y}_{3} \mathrm{I}\right) .
$$

It is easily verified $\eta$ is a ring isomorphism.
By considering $\phi: \mathrm{N} \rightarrow \mathrm{M}$ given by $\phi\left(\mathrm{x}_{1}+\mathrm{y}_{1} \mathrm{I}, \mathrm{x}_{2}+\mathrm{y}_{2} \mathrm{I}, \mathrm{x}_{3}+\mathrm{y}_{3} \mathrm{I}\right)$
$=\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right)+\left(\mathrm{y}_{1}, \mathrm{y}_{2}, \mathrm{y}_{3}\right) \mathrm{I}$ we see $\phi$ is an isomorphism from N to M .

Thus N and M are isomorphic, that is we say M and N are isomorphically equivalent so we can take M is place of N and vice versa. Hence we can work with a $\mathrm{m} \times \mathrm{n}$ matrix with entries from $\langle\mathrm{Z} \cup \mathrm{I}\rangle\left(\langle\mathrm{R} \cup \mathrm{I}\rangle\right.$ or $\langle\mathrm{Q} \cup \mathrm{I}\rangle$ or $\left.\left\langle\mathrm{Z}_{\mathrm{n}} \cup \mathrm{I}\right\rangle\right)$ or $\mathrm{A}+\mathrm{BI}$ where A and $B$ are $m \times n$ matrices with entries from $Z$ ( or $R$ or $Q$ or $Z_{n}$ ).

We will only illustrate this situation by some examples.

## Example 4.17: Let

$$
M=\left\{\left.\left(\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right) \right\rvert\, a_{i} \in\left\langle Z_{25} \cup I\right\rangle ; 1 \leq i \leq 9 ; I^{2}=I\right\}
$$

be the general neutrosophic ring of $3 \times 3$ matirces of special dual like numbers.

Take

$$
\begin{array}{r}
N=\left\{\left.\left(\begin{array}{lll}
x_{1} & x_{2} & x_{3} \\
x_{4} & x_{5} & x_{6} \\
x_{7} & x_{8} & x_{9}
\end{array}\right)+\left(\begin{array}{lll}
y_{1} & y_{2} & y_{3} \\
y_{4} & y_{5} & y_{6} \\
y_{7} & y_{8} & y_{9}
\end{array}\right) \right\rvert\, \text { I } x_{i}, y_{j} \in Z_{5} ;\right. \\
\left.1 \leq i, j \leq 9 ; \mathrm{I}^{2}=\mathrm{I}\right\}
\end{array}
$$

be the general ring of neutrosophic matrix special dual like numbers.

We see $\eta: M \rightarrow N$ defined by

$$
\begin{gathered}
\eta\left(\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right)=\eta\left(\begin{array}{lll}
x_{1}+y_{1} I & x_{2}+y_{2} I & x_{3}+y_{3} I \\
x_{4}+y_{4} I & x_{5}+y_{5} I & x_{6}+y_{6} I \\
x_{7}+y_{7} I & x_{8}+y_{8} I & x_{9}+y_{9} I
\end{array}\right) \\
=\left(\begin{array}{lll}
x_{1} & x_{2} & x_{3} \\
x_{4} & x_{5} & x_{6} \\
x_{7} & x_{8} & x_{9}
\end{array}\right)+\left(\begin{array}{lll}
y_{1} & y_{2} & y_{3} \\
y_{4} & y_{5} & y_{6} \\
y_{7} & y_{8} & y_{9}
\end{array}\right) I \in N .
\end{gathered}
$$

Clearly $\eta$ is a ring isomorphism.
Consider $\phi: \mathrm{N} \rightarrow \mathrm{M}$ given by

$$
\begin{gathered}
\phi\left(\left(\begin{array}{lll}
x_{1} & x_{2} & x_{3} \\
x_{4} & x_{5} & x_{6} \\
x_{7} & x_{8} & x_{9}
\end{array}\right)+\left(\begin{array}{lll}
y_{1} & y_{2} & y_{3} \\
y_{4} & y_{5} & y_{6} \\
y_{7} & y_{8} & y_{9}
\end{array}\right)\right) \\
=\left(\begin{array}{lll}
x_{1}+y_{1} I & x_{2}+y_{2} I & x_{3}+y_{3} I \\
x_{4}+y_{4} I & x_{5}+y_{5} I & x_{6}+y_{6} I \\
x_{7}+y_{7} I & x_{8}+y_{8} I & x_{9}+y_{9} I
\end{array}\right) .
\end{gathered}
$$

$\phi$ is again a ring isomorphism thus $\mathrm{N} \cong \mathrm{M}$ and $\mathrm{M} \cong \mathrm{N}$. So we say M can be replaced by N and vice versa.

## Example 4.18: Let

$$
S=\left\{\begin{array}{l}
{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4} \\
a_{5} \\
a_{6}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} I ; x_{i}, y_{i} \in Z_{11} ; 1 \leq i \leq 6 ; I^{2}=I, ~}
\end{array}\right.
$$

that is $\left.\mathrm{a}_{\mathrm{i}} \in\left\langle\mathrm{Z}_{11} \cup \mathrm{I}\right\rangle\right\}$ be the general ring of neutrosophic column matrix of special dual like elements.

Take

$$
P=\left\{\left.\left[\begin{array}{l}
x_{1} \\
x_{2} \\
x_{3} \\
x_{4} \\
x_{5} \\
x_{6}
\end{array}\right]+\left[\begin{array}{l}
y_{1} \\
y_{2} \\
y_{3} \\
y_{4} \\
y_{5} \\
y_{6}
\end{array}\right] \right\rvert\, x_{i}, y_{i} \in Z_{11} ; 1 \leq i, j \leq 6 ; I^{2}=I\right\}
$$

be the general ring of column matrix coefficient neutrosophic special dual like number.

Clearly $\eta$ : $S \rightarrow P$ defined by

$$
\eta\left(\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4} \\
a_{5} \\
a_{6}
\end{array}\right]\right)=\eta\left(\left[\begin{array}{l}
x_{1}+y_{1} I \\
x_{2}+y_{2} I \\
x_{3}+y_{3} I \\
x_{4}+y_{4} I \\
x_{5}+y_{5} I \\
x_{6}+y_{6} I
\end{array}\right]\right)=\left[\begin{array}{l}
x_{1} \\
x_{2} \\
x_{3} \\
x_{4} \\
x_{5} \\
x_{6}
\end{array}\right]+\left[\begin{array}{l}
y_{1} \\
y_{2} \\
y_{3} \\
y_{4} \\
y_{5} \\
y_{6}
\end{array}\right] I \in P
$$

$\eta$ is a ring isomorphism that is $S \cong P$.

Similarly $\phi: \mathrm{P} \rightarrow \mathrm{S}$ can be defined such that;

$$
\phi\left(\left[\begin{array}{l}
x_{1} \\
x_{2} \\
x_{3} \\
x_{4} \\
x_{5} \\
x_{6}
\end{array}\right]+\left[\begin{array}{l}
y_{1} \\
y_{2} \\
y_{3} \\
y_{4} \\
y_{5} \\
y_{6}
\end{array}\right]\right)=\left(\left[\begin{array}{l}
x_{1}+y_{1} I \\
x_{2}+y_{2} I \\
x_{3}+y_{3} I \\
x_{4}+y_{4} I \\
x_{5}+y_{5} I \\
x_{6}+y_{6} I
\end{array}\right]\right) \in \mathrm{S}
$$

thus $\phi$ is an isomorphism of rings and $P \cong S$. Thus as per need $S$ can be replaced by P and vice versa.

Finally it is a matter of routine to check if

$$
M=\left\{\left.\left(\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{10} \\
a_{11} & a_{12} & \ldots & a_{20} \\
a_{21} & a_{22} & \ldots & a_{30}
\end{array}\right) \right\rvert\, a_{i} \in\langle Q \cup I\rangle ; 1 \leq i \leq 30\right\}
$$

be the general ring of neutrosophic matrix of special dual like numbers and if

$$
\begin{array}{r}
\mathrm{N}=\left\{\begin{aligned}
\left\{\begin{array}{cccc}
\mathrm{x}_{1} & \mathrm{x}_{2} & \ldots & \mathrm{x}_{10} \\
\mathrm{x}_{11} & \mathrm{x}_{12} & \ldots & \mathrm{x}_{20} \\
\mathrm{x}_{21} & \mathrm{x}_{22} & \ldots & \mathrm{x}_{30}
\end{array}\right)+\left(\begin{array}{cccc}
\mathrm{y}_{1} & \mathrm{y}_{2} & \ldots & \mathrm{y}_{10} \\
\mathrm{y}_{11} & \mathrm{y}_{12} & \ldots & \mathrm{y}_{20} \\
\mathrm{y}_{21} & \mathrm{y}_{22} & \ldots & \mathrm{y}_{30}
\end{array}\right) \mathrm{I} \\
\text { where } \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{j}} \in \mathrm{Q}, 1 \leq i, j \leq 30, \mathrm{I}^{2}=\mathrm{I}\right\}
\end{aligned}\right. \\
\end{array}
$$

be the general neutrosophic matrix ring of special dual like numbers then $M$ is isomorphic with $N$. Hence we can use $M$ in place of N or vice versa as per the situation.

Now finally we show the same is true for polynomial rings with matrix coefficients.

For if $\mathrm{p}(\mathrm{x})=\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}}$ with $\mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{I} ; 0 \leq \mathrm{i} \leq \mathrm{n}$ then

$$
\mathrm{p}(\mathrm{x})=\sum_{\mathrm{i}=0}^{\mathrm{n}} \mathrm{x}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}}+\sum_{\mathrm{i}=0}^{\mathrm{n}} \mathrm{y}_{\mathrm{i}} \mathrm{I} \mathrm{x}^{\mathrm{i}}=\sum_{\mathrm{i}=0}^{\mathrm{n}} \mathrm{x}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}}+\left(\sum_{\mathrm{i}=0}^{\mathrm{n}} \mathrm{y}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}}\right) \mathrm{I}
$$

$$
\text { for } x_{i}, y_{i} \in Q\left(\text { or } Z \text { or } R \text { or } Z_{n}\right) .
$$

Similarly if

$$
p(x)=\sum_{i=0}^{n} a_{i} x^{i} \text { with } a_{i}=\left(\begin{array}{c}
x_{1}+y_{1} I \\
x_{2}+y_{2} I \\
x_{3}+y_{3} I \\
x_{4}+y_{4} I
\end{array}\right)=\left(\begin{array}{l}
x_{1} \\
x_{2} \\
x_{3} \\
x_{4}
\end{array}\right)+\left(\begin{array}{l}
y_{1} \\
y_{2} \\
y_{3} \\
y_{4}
\end{array}\right) I
$$

for $\mathrm{x}_{\mathrm{j}}, \mathrm{y}_{\mathrm{k}} \in \mathrm{Q}\left(\right.$ or Z or R or $\left.\mathrm{Z}_{\mathrm{n}}\right) ; 1 \leq \mathrm{j}, \mathrm{k} \leq 4 ; 0 \leq \mathrm{i} \leq \mathrm{n}$.

$$
\begin{aligned}
& \text { Thus } \left.p(x)=\sum_{i=0}^{\infty} a_{i} x^{i}=\sum_{i=0}^{\infty}\left(\begin{array}{l}
x_{1} \\
x_{2} \\
x_{3} \\
x_{4}
\end{array}\right) x^{i}+\sum_{i=0}^{\infty}\left(\left(\begin{array}{l}
y_{1} \\
y_{2} \\
y_{3} \\
y_{4}
\end{array}\right)\right) I\right) x^{i} \\
& =\sum_{i=0}^{\infty}\left(\begin{array}{l}
x_{1}^{i} \\
x_{2}^{i} \\
x_{3}^{i} \\
x_{4}^{i}
\end{array}\right) x^{i}+\left(\sum_{i=0}^{\infty}\left(\begin{array}{c}
y_{1}^{i} \\
y_{2}^{i} \\
y_{3}^{i} \\
y_{4}^{i}
\end{array}\right) x^{i}\right) I .
\end{aligned}
$$

Similar results hold good for row neutrosophic matrices, rectangular neutrosophic matrices or square neutrosophic matrices as coefficient of the polynomials. Hence as per need we can replace one polynomial ring by its equivalent polynomial ring and vice versa.

All properties of rings can be derived for general neutrosophic rings of special dual like numbers. This is left as an exercise to the student as it can be realized as a matter of
routine. Now we can also build using the neutrosophic dual like numbers $\mathrm{a}+\mathrm{bI}\left(\mathrm{a}, \mathrm{b} \in \mathrm{R}\right.$ or Q or Z or $\left.\mathrm{Z}_{\mathrm{n}}\right)$ vector spaces.

Let
$V=\left\{\left(a_{1}, a_{2}, \ldots, a_{15}\right) \mid a_{i}=x_{i}+y_{i} I ; 1 \leq i \leq 15, I^{2}=I, x_{i}, y_{i} \in Q\right\}$ be the general neutrosophic vector space of special dual like numbers over the field Q .

We see V is also a general neutrosophic linear algebra of special dual like numbers.

This definition and the properties are a matter of routine hence left as an exercise to the reader. So we provide only some examples of them.

Example 4.19: Let

$$
\mathrm{V}=\left\{\left.\left(\begin{array}{ccc}
\mathrm{a}_{1} & a_{2} & a_{3} \\
\mathrm{a}_{4} & a_{5} & a_{6} \\
\mathrm{a}_{7} & a_{8} & a_{9} \\
\mathrm{a}_{10} & a_{11} & a_{12} \\
a_{13} & a_{14} & a_{15}
\end{array}\right) \right\rvert\, \mathrm{a}_{\mathrm{i}} \in\langle\mathrm{Q} \cup \mathrm{I}\rangle ; 1 \leq \mathrm{i} \leq 15\right\}
$$

be a general neutrosophic vector space of special dual like numbers over the field Q . Infact using the natural product $x_{n}$ of matrices. V is a linear algebra of neutrosophic special dual like numbers.

Example 4.20: Let

$$
\mathrm{W}=\left\{\left.\left(\begin{array}{c}
\mathrm{a}_{1} \\
\mathrm{a}_{2} \\
\vdots \\
\mathrm{a}_{15}
\end{array}\right) \right\rvert\, \mathrm{a}_{\mathrm{i}} \in\left\langle\mathrm{Z}_{19} \cup \mathrm{I}\right\rangle ; 1 \leq \mathrm{i} \leq 15\right\}
$$

be the general neutrosophic vector space of special dual like numbers over the field $\mathrm{Z}_{19}$.

## Example 4.21: Let

$$
P=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i} \in\langle R \cup I\rangle ; 1 \leq i \leq 9\right\}
$$

be the general neutrosophic Smarandache vector space of special dual like numbers over the Smarandache ring $\langle R \cup I\rangle$.

The eigen values and eigen vectors associated with $P$ can be special dual like numbers from $\langle\mathrm{R} \cup \mathrm{I}\rangle$.

All other properties like basis, dimension, subspaces, direct sum, pseudo direct sum, linear transformation and linear operator can be found in case of general neutrosophic vector spaces of special dual like numbers which is a matter of routine and hence is left as an exercise to the reader.

Now we can also define neutrosophic general semiring / semifield of special dual like numbers and also the concept of general neutrosophic vector spaces of special dual like numbers.

We only illustrate them by some examples as they are direct and hence left for the reader as an exercise.

Example 4.22: Let $\mathrm{M}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{I}\right.$ where $\mathrm{a}_{\mathrm{i}} \in$ $\left.\left\langle\mathrm{R}^{+} \cup\{0\} \cup \mathrm{I}\right\rangle, 1 \leq \mathrm{i} \leq 3, \mathrm{I}^{2}=\mathrm{I}\right\}$ be the general semiring of neutrosophic special dual like numbers.

Clearly $M$ is not a semifield as $M$ has zero divisors, however M is a strict semiring.

Example 4.23: Let

$$
\mathrm{W}=\left\{\left.\left(\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4} \\
a_{5}
\end{array}\right) \right\rvert\, a_{i}=x_{i}+y_{i} I, x_{i}, y_{i} \in Z^{+} \cup\{0\}, \mathrm{I}^{2}=\mathrm{I}, 1 \leq i \leq 5\right\}
$$

be the general neutrosophic semiring of special dual like numbers under the natural product $\times_{n}$. Clearly $W$ is not a semifield.

Example 4.24: Let

$$
\mathrm{T}=\left\{\left.\left[\begin{array}{ll}
\mathrm{a}_{1} & \mathrm{a}_{2} \\
\mathrm{a}_{3} & a_{4}
\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{I}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 4\right\}
$$

be the general neutrosophic non commutation semiring of special dual like numbers. T is not a general neutrosophic semifield.

## Example 4.25: Let

$$
\begin{array}{r}
S=\left\{\begin{aligned}
{ \left.\left[\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{12} \\
a_{13} & a_{14} & \ldots & a_{24} \\
a_{25} & a_{26} & \ldots & a_{36} \\
a_{37} & a_{38} & \ldots & a_{48}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} I, } \\
\left.x_{i}, y_{i} \in Z^{+} \cup\{0\}, 1 \leq i \leq 48\right\}
\end{aligned}\right.
\end{array}
$$

be the general neutrosophic special dual like number semiring under natural product. S has zero divisors, so is not a semifield.

## Example 4.26: Let

$$
\begin{aligned}
& \left.S=\left\{\begin{array}{llll}
a_{1} & a_{2} & a_{3} & a_{4} \\
a_{5} & a_{6} & a_{7} & a_{8} \\
a_{9} & a_{10} & a_{11} & a_{12}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} I, x_{i}, y_{i} \in Z^{+}, \\
& 1 \leq \mathrm{i} \leq 12\} \cup\left\{\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right]\right\}
\end{aligned}
$$

be the general special neutrosophic semivector space over the semifield $Z^{+} \cup\{0\}$ of special dual like numbers.

Clearly $M$ under the $\times_{\mathrm{n}}$ is a linear algebra.
Also M is a semifield.

## Example 4.27: Let

$$
\begin{array}{r}
T=\left\{\begin{array}{lll}
{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} I, x_{i}, y_{i} \in Q^{+},} \\
\left.1 \leq i \leq 9, I^{2}=I\right\} \cup\left\{\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]\right\}
\end{array},\right\} \text {, }
\end{array}
$$

be the semifield of general neutrosophic special dual like numbers only under $\times_{\mathrm{n}}$, under usual product $\times, \mathrm{T}$ is only a semidivision ring.

Example 4.28: Let $\mathrm{W}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \mathrm{a}_{4}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{I}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+}\right.$; $1 \leq \mathrm{i} \leq 4\} \cup\{(0,0,0,0)\}$ be a semifield of general neutrosophic special dual like numbers.

Example 4.29: Let

$$
\begin{aligned}
& V=\left\{\left.\left[\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{10} \\
a_{11} & a_{12} & \ldots & a_{20}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} I,\right. \\
&\left.x_{i}, y_{i} \in\left\langle R^{+} \cup\{0\} \cup I\right\rangle, 1 \leq i \leq 20\right\}
\end{aligned}
$$

be the semiring of neutrosophic special dual like numbers under natural product $x_{n}$. V is not a semifield however V is a general neutrosophic semilinear algebra of special dual like numbers over the semifield $\mathrm{R}^{+} \cup\{0\}$.

Infact V is a strong Smarandache semilinear algbera of neutrosophic special dual like numbers over the Smarandache general neutrosophic ring of special dual like numbers.

Example 4.30: Let

$$
\begin{aligned}
& B=\left\{\left.\left(\begin{array}{llll}
a_{1} & a_{2} & a_{3} & a_{4} \\
a_{5} & a_{6} & a_{7} & a_{8} \\
a_{9} & a_{10} & a_{11} & a_{12}
\end{array}\right) \right\rvert\, a_{i}=x_{i}+y_{i} I,\right. \\
& \left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 12\right\}
\end{aligned}
$$

be the general semilinear algebra of special dual like numbers over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

All properties related with semivector spaces / semilinear algebras of special dual like numbers over the semifield like basis, dimension, semilinear transformation, semilinear operator, semilinear functions, direct sum of semivector subspaces and pseudo direct sum of semivector spaces can be derived in case of these new structure. As it is direct it is
considered as a matter of routine and hence is left as an exercise to the reader.

Now can we have higher dimensional neutrosophic special dual like numbers. We construct them in the following.

## Let

$R\left(g_{1}, g_{2}\right)=\left\{x_{1}+x_{2} g_{1}+x_{3} g_{2} \mid g_{1}=(I, I, I)\right.$ and $\left.g_{2}=(I, 0, I)\right\}$ is a three dimensional neutrosophic special dual like number.

$$
\begin{aligned}
\text { For if } \mathrm{a} & =3+4(\mathrm{I}, \mathrm{I}, \mathrm{I})+2(\mathrm{I}, 0, \mathrm{I}) \\
\text { and } \mathrm{b} & =-1+3(\mathrm{I}, \mathrm{I}, \mathrm{I})-7(\mathrm{I}, 0, \mathrm{I}) \text { are in } \mathrm{R}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right) \text { then } \\
\mathrm{a}+\mathrm{b} & =2+7(\mathrm{I}, \mathrm{I}, \mathrm{I})-5(\mathrm{I}, 0, \mathrm{I})
\end{aligned}
$$

and $\mathrm{a} \times \mathrm{b}=-3-4(\mathrm{I}, \mathrm{I}, \mathrm{I})-2(\mathrm{I}, 0, \mathrm{I})+9(\mathrm{I}, \mathrm{I}, \mathrm{I})+12(\mathrm{I}, \mathrm{I}, \mathrm{I})+$ $6(\mathrm{I}, 0, \mathrm{I})-21(\mathrm{I}, 0, \mathrm{I})-28(\mathrm{I}, 0, \mathrm{I})-14(\mathrm{I}, 0, \mathrm{I})$

$$
=-3+17(\mathrm{I}, \mathrm{I}, \mathrm{I})-49(\mathrm{I}, 0, \mathrm{I}) \in \mathrm{R}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right)
$$

It is easily verified $R\left(g_{1}, g_{2}\right)$ is a general ring of neutrosophic special dual like numbers of dimension three.

Likewise we can build many three dimensional neutrosophic special dual like numbers.

For $\mathrm{Q}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 3\right.$,

$$
\left.\mathrm{g}_{1}=\left[\begin{array}{ll}
\mathrm{I} & \mathrm{I} \\
\mathrm{I} & 0 \\
0 & \mathrm{I}
\end{array}\right] \text { and } \mathrm{g}_{2}=\left[\begin{array}{cc}
\mathrm{I} & \mathrm{I} \\
\mathrm{I} & \mathrm{I} \\
\mathrm{I} & \mathrm{I}
\end{array}\right], \mathrm{I}^{2}=\mathrm{I}\right\} ;\left(\mathrm{Q}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right), \times_{\mathrm{n}},+\right)
$$

is a general neutrosophic using of special dual like numbers.
Example 4.31: Let $\mathrm{W}=\left\{\mathrm{Z}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)\right\}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}\right) \mid \mathrm{a}_{\mathrm{i}} \in$ $\mathrm{Z} ; 1 \leq \mathrm{i} \leq 3, \mathrm{~g}_{1}=(\mathrm{I}, \mathrm{I}, \mathrm{I}, \mathrm{I}, \mathrm{I})$ and $\left.\mathrm{g}_{2}=(0, \mathrm{I}, 0, \mathrm{I}, 0)\right\}$ be a three dimensional special dual like number general neutrosophic ring.

Example 4.32: Let $\mathrm{M}=\left\{\mathrm{Q}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)\right\}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}\right.$ where $\mathrm{a}_{\mathrm{i}}$ $\in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 3 ; \mathrm{g}_{1}=\left[\begin{array}{cc}\mathrm{I} & 0 \\ 0 & \mathrm{I}\end{array}\right]$ and $\left.\mathrm{g}_{2}=\left[\begin{array}{cc}\mathrm{I} & \mathrm{I} \\ \mathrm{I} & \mathrm{I}\end{array}\right]\right\}$; be a three dimensional neutrosophic special dual like number ring where $\mathrm{g}_{1} \times_{\mathrm{n}} \mathrm{g}_{2}=\mathrm{g}_{1}$. Clearly M under the usual product is also M is a three dimensional neutrosophic special dual like number ring of $\mathrm{g}_{1} \times \mathrm{g}_{2}=\mathrm{g}_{2}$.

However both rings are different.
In this matter we can define any desired dimensional neutrosophic special dual like numbers; we give only examples of them.

Example 4.33: Let $Z\left(g_{1}, g_{2}, g_{3}\right)=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3} \mid a_{i} \in\right.$ $\mathrm{Z}, 1 \leq \mathrm{i} \leq 4$ with $\mathrm{g}_{1}=(\mathrm{I}, \mathrm{I}, \mathrm{I}, \mathrm{I}, \mathrm{I}, \mathrm{I}), \mathrm{g}_{2}=(\mathrm{I}, 0, \mathrm{I}, 0, \mathrm{I}, 0)$ and $\mathrm{g}_{3}=$ $(0, I, 0, I, 0, I)$ where $g_{i}^{2}=g_{i}, i=1,2,3 ; g_{1} g_{2}=(I, 0, I, 0, I, 0)$, $\mathrm{g}_{2} \mathrm{~g}_{3}=(0,0,0,0,0,0)$ and $\left.\mathrm{g}_{1} \mathrm{~g}_{3}=(0, \mathrm{I}, 0, \mathrm{I}, 0, \mathrm{I})\right\}$ be a four dimensional neutrosophic general special dual like number ring.

Example 4.34: Let $Z\left(g_{1}, g_{2}, g_{3}, g_{4}, g_{5}\right)=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}\right.$ $+a_{5} \mathrm{~g}_{4}+\mathrm{a}_{6} \mathrm{~g}_{5} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Z} ; 1 \leq \mathrm{i} \leq 6 ; \mathrm{g}_{1}=(\mathrm{I}, 0,0,0,0), \mathrm{g}_{2}=(0, \mathrm{I}, 0,0$, $0) g_{3}=(0,0, I, 0,0), g_{4}=(0,0,0, I, 0)$ and $\left.g_{5}=(0,0,0,0, I)\right\}$ be the general neutrosophic ring of six dimensional special dual like numbers.

## Example 4.35: Let

$$
\begin{gathered}
\mathrm{Z}_{7}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}, \mathrm{~g}_{4}, \mathrm{~g}_{5}, \mathrm{~g}_{7}, \mathrm{~g}_{8}\right)=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{a}_{9} \mathrm{~g}_{8}, \mathrm{a}_{\mathrm{j}} \in \mathrm{Z}_{7} ;\right. \\
1 \leq \mathrm{j} \leq 9, \mathrm{~g}_{1}=\left[\begin{array}{cccc}
\mathrm{I} & 0 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right], \mathrm{g}_{2}=\left[\begin{array}{cccc}
0 & \mathrm{I} & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right], \\
\mathrm{g}_{3}=\left[\begin{array}{llll}
0 & 0 & \mathrm{I} & 0 \\
0 & 0 & 0 & 0
\end{array}\right], \mathrm{g}_{4}=\left[\begin{array}{llll}
0 & 0 & 0 & \mathrm{I} \\
0 & 0 & 0 & 0
\end{array}\right], \mathrm{g}_{5}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
\mathrm{I} & 0 & 0 & 0
\end{array}\right],
\end{gathered}
$$

$$
\begin{array}{r}
\mathrm{g}_{6}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & \mathrm{I} & 0 & 0
\end{array}\right], \mathrm{g}_{7}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & \mathrm{I} & 0
\end{array}\right] \text { and } \\
\left.\mathrm{g}_{8}=\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & \mathrm{I}
\end{array}\right]\right\}
\end{array}
$$

be the nine dimensional general neutrosophic ring of special dual like numbers of finite order.

Thus we can construct any n-dimensional neutrosophic ring of special dual like numbers.

We can also have semirings / semifield of neutrosophic special dual like numbers of desired dimension.

We will only illustrate this situation by some examples.

## Example 4.36: Let

$$
\begin{array}{r}
S=\left\{a_{1}+a_{2} g_{1}+a=g_{2}+a_{4} g_{3}+a_{5} g_{4} \mid a_{i} \in R^{+} \cup\{0\} ;\right. \\
1 \leq i \leq 5, g_{1}=\left[\begin{array}{ll}
\mathrm{I} & 0 \\
0 & 0
\end{array}\right], g_{2}=\left[\begin{array}{ll}
0 & \mathrm{I} \\
0 & 0
\end{array}\right], g_{3}=\left[\begin{array}{ll}
0 & 0 \\
\mathrm{I} & 0
\end{array}\right] \\
\text { and } \left.\mathrm{g}_{4}=\left[\begin{array}{ll}
0 & 0 \\
0 & \mathrm{I}
\end{array}\right]\right\}
\end{array}
$$

be a five dimensional neutrosophic dual like number semiring. Clearly S is only a semiring and not a semifield.

## Example 4.37: Let

$$
S=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}+a_{5} g_{4}+a_{6} g_{5}+a_{7} g_{6}+a_{8} g_{7} \mid\right.
$$

$$
\begin{gathered}
\mathrm{a}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\} ; 1 \leq \mathrm{i} \leq 8, \mathrm{~g}_{1}=\left[\begin{array}{c}
\mathrm{I} \\
0 \\
0 \\
\vdots \\
0
\end{array}\right], \mathrm{g}_{2}=\left[\begin{array}{c}
0 \\
\mathrm{I} \\
0 \\
\vdots \\
0
\end{array}\right], \\
\left.\mathrm{g}_{3}=\left[\begin{array}{l}
\mathrm{I} \\
\mathrm{I} \\
0 \\
\vdots \\
0
\end{array}\right], \mathrm{g}_{4}=\left[\begin{array}{l}
0 \\
\mathrm{I} \\
0 \\
0 \\
\vdots \\
0
\end{array}\right], \mathrm{g}_{5}=\left[\begin{array}{l}
0 \\
0 \\
\mathrm{I} \\
0 \\
0 \\
\vdots \\
0
\end{array}\right], \mathrm{g}_{6}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
0 \\
\mathrm{I} \\
0 \\
0 \\
0
\end{array}\right], \mathrm{g}_{7}=\left[\begin{array}{c}
0 \\
\vdots \\
0 \\
\mathrm{I} \\
0
\end{array}\right], \mathrm{g}_{8}=\left[\begin{array}{c}
0 \\
0 \\
\vdots \\
0 \\
\mathrm{I}
\end{array}\right]\right\}
\end{gathered}
$$

be the eight dimensional neutrosophic special dual like number semiring. Clearly S is not a semifield.

Now having seen examples of any higher dimensional neutrosophic special dual like numbers we can as a matter of routine construct semivector spaces and vector spaces of higher dimensional neutrosophic special dual like numbers.

## Example 4.38: Let

$$
\begin{aligned}
& V=\left\{\begin{array}{l}
{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}, 1 \leq i \leq 4, x_{i} \in Q,} \\
\end{array}\right. \\
& \left.\mathrm{g}_{1}=(\mathrm{I}, 0,0), \mathrm{g}_{2}=(0, \mathrm{I}, 0) \text { and } \mathrm{g}_{3}=(0,0, \mathrm{I})\right\}
\end{aligned}
$$

be a special neutrosophic four dimensional vector space of special dual like numbers over the field Q .

Example 4.39: Let

$$
\begin{aligned}
& \left.T=\left\{\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9} \\
a_{10} & a_{11} & a_{12}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+ \\
& \mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5} ; 1 \leq \mathrm{i} \leq 12, \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{19}, 1 \leq \mathrm{j} \leq 6, \\
& \mathrm{~g}_{1}=\left[\begin{array}{ll}
\mathrm{I} & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right], \mathrm{g}_{2}=\left[\begin{array}{ll}
0 & \mathrm{I} \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right], \mathrm{g}_{3}=\left[\begin{array}{ll}
0 & 0 \\
\mathrm{I} & 0 \\
0 & 0 \\
0 & 0
\end{array}\right], \mathrm{g}_{4}=\left[\begin{array}{ll}
0 & 0 \\
0 & \mathrm{I} \\
0 & 0 \\
0 & 0
\end{array}\right] \\
& \left.\mathrm{g}_{5}=\left[\begin{array}{ll}
0 & 0 \\
0 & 0 \\
0 & 0 \\
\mathrm{I} & 0
\end{array}\right]\right\}
\end{aligned}
$$

be the general neutrosophic for six dimensional vector space of special dual like numbers over the field $\mathrm{Z}_{19} . \mathrm{T}$ is a finite order.

## Example 4.40: Let

$$
S=\left\{\left.\left[\begin{array}{llll}
a_{1} & a_{2} & a_{3} & a_{4} \\
a_{5} & a_{6} & a_{7} & a_{8}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+\right.
$$

$\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}+\mathrm{x}_{8} \mathrm{~g}_{7}+\mathrm{x}_{9} \mathrm{~g}_{8}$ where $1 \leq \mathrm{i} \leq 8, \mathrm{x}_{\mathrm{j}} \in \mathrm{Q}^{+} \cup\{0\}$,

$$
1 \leq \mathrm{j} \leq 9 \text { with } \mathrm{g}_{1}=\left[\begin{array}{lll}
\mathrm{I} & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right], \mathrm{g}_{2}=\left[\begin{array}{lll}
0 & \mathrm{I} & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]
$$

$$
\begin{gathered}
\mathrm{g}_{3}=\left[\begin{array}{lll}
0 & 0 & \mathrm{I} \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right], \mathrm{g}_{4}=\left[\begin{array}{lll}
0 & 0 & 0 \\
\mathrm{I} & 0 & 0 \\
0 & 0 & 0
\end{array}\right], \mathrm{g}_{5}=\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & \mathrm{I} & 0 \\
0 & 0 & 0
\end{array}\right], \\
\left.\mathrm{g}_{6}=\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & \mathrm{I} \\
0 & 0 & 0
\end{array}\right], \mathrm{g}_{7}=\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
\mathrm{I} & 0 & 0
\end{array}\right] \text { and } \mathrm{g}_{8}=\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & \mathrm{I} & 0
\end{array}\right]\right\}
\end{gathered}
$$

be a general neutrosophic nine dimensional semivector space of special dual like numbers over the semifield $\mathrm{Q}^{+} \cup\{0\}$.

Example 4.41: Let

$$
\begin{gathered}
M=\left\{\left.\left[\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{5} \\
a_{6} & a_{7} & \ldots & a_{10}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+\right. \\
x_{5} g_{4}+x_{6} g_{5}+x_{7} g_{6} ; 1 \leq i \leq 10, \\
x_{j} \in x_{24} ; 1 \leq j \leq 7 ; g_{1}=\left[\begin{array}{ll}
I & 0 \\
0 & 0 \\
0 & 0
\end{array}\right], g_{2}=\left[\begin{array}{ll}
0 & I \\
0 & 0 \\
0 & 0
\end{array}\right], g_{3}=\left[\begin{array}{ll}
0 & 0 \\
I & 0 \\
0 & 0
\end{array}\right], \\
\left.g_{4}=\left[\begin{array}{ll}
0 & 0 \\
0 & I \\
0 & 0
\end{array}\right], g_{5}=\left[\begin{array}{ll}
0 & 0 \\
0 & 0 \\
I & 0
\end{array}\right] \text { and } g_{6}=\left[\begin{array}{ll}
0 & 0 \\
0 & 0 \\
0 & I
\end{array}\right]\right\}
\end{gathered}
$$

be a general neutrosophic seven dimensional Smarandache vector space over the $S$-ring $Z_{24}$ of special dual like numbers.

## Example 4.42: Let

$$
\begin{aligned}
& M=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}\right. \\
& \text { with } g_{1}=(0,0,0, I), g_{2}=(0,0, I, 0) g_{3}=(0, I, 0,0) \text { and } \\
& \left.g_{4}=(I, 0,0,0), x_{j} \in\left\langle Q^{+} \cup\{0\} \cup I\right\rangle 1 \leq j \leq 4,1 \leq i \leq 9\right\}
\end{aligned}
$$

be a general neutrosophic strong semivector space of special dual like numbers over the semifield $\left\langle\mathrm{Q}^{+} \cup\{0\} \cup \mathrm{I}\right\rangle$.

Clearly under the natural product $\times_{n} ; M$ is a strong semilinear algebra over the $\left\langle\mathrm{Q}^{+} \cup\{0\} \cup \mathrm{I}\right\rangle$. Likewise with usual product $\times, \mathrm{M}$ is a strong non commutative semilinear algebra over $\left\langle\mathrm{Q}^{+} \cup\{0\} \cup \mathrm{I}\right\rangle$.

Thus working with properties of these structures is considered as a matter of routine and this task is left as an exercise to the reader.

## Chapter Five

## Mxed DuAl Numbers

In this chapter we proceed onto define the new notion of mixed dual numbers. We say $x=a_{1}+a_{2} g_{1}+a_{3} g_{2}$ is a mixed dual number if $g_{1}^{2}=g_{1}$ and $g_{2}^{2}=0$ with $g_{1} g_{2}=g_{2} g_{1}=g_{1}$ (or $g_{2}$ or 0 where $g_{1}, g_{2}$ are known as the new elements and $a_{1}, a_{2}, a_{3} \in$ R ( or Q or Z or $\mathrm{Z}_{\mathrm{n}}$ ).

First we will illustrate this situation by some examples.
Example 5.1: Let $\mathrm{S}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Q}, \quad 1 \leq \mathrm{i} \leq 3\right.$, $\mathrm{g}_{1}=4, \mathrm{~g}_{2}=6 ; 4,6 \in \mathrm{Z}_{12} ; \mathrm{g}_{1}^{2}=\mathrm{g}_{1}(\bmod 12)$ and $\mathrm{g}_{2}^{2}=0(\bmod$ $12)$ \} be a mixed dual number collection.

Example 5.2: Let $\mathrm{T}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Z}, 1 \leq \mathrm{i} \leq 3, \mathrm{~g}_{1}=9\right.$ and $\mathrm{g}_{2}=6$ in $\mathrm{Z}_{12}$ with $\mathrm{g}_{1}^{2}=\mathrm{g}_{1}(\bmod 12)$ and $\mathrm{g}_{2}^{2}=0(\bmod 12)$ $\left.\mathrm{g}_{1} \mathrm{~g}_{2}=9 \times 6=54 \equiv 6(\bmod 12)\right\}$ be the mixed dual number.

Mixed dual numbers should have minimum dimension to be three.

Example 5.3: Let $\mathrm{S}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Q}, \quad 1 \leq \mathrm{i} \leq 3\right.$, $\mathrm{g}_{1}=5$ and $\mathrm{g}_{2}=10 \in \mathrm{Z}_{20}, \mathrm{~g}_{1}^{2}=5(\bmod 20)$ and $\left.\mathrm{g}_{2}^{2}=0(\bmod 20)\right\}$ be the mixed dual number.

$$
\begin{aligned}
& \text { Consider } \mathrm{x}=5+3 \mathrm{~g}_{1}+2 \mathrm{~g}_{2} \text { and } \mathrm{y}=3-4 \mathrm{~g}_{1}+5 \mathrm{~g}_{2} \text { in } \mathrm{S} \\
& \begin{aligned}
& \mathrm{x}+\mathrm{y}=8-\mathrm{g}_{1}+7 \mathrm{~g}_{2} \in \mathrm{~S} \\
& \mathrm{x} \times \mathrm{y}=\left(5+3 \mathrm{~g}_{1}+2 \mathrm{~g}_{2}\right) \times\left(3-4 \mathrm{~g}+5 \mathrm{~g}_{2}\right) \\
&= 15+9 \mathrm{~g}_{1}+6 \mathrm{~g}_{2}-20 \mathrm{~g}_{1}-12 \mathrm{~g}_{1}-8 \mathrm{~g}_{2}+25 \mathrm{~g}_{2}+15 \mathrm{~g}_{2}+0 \\
&= 15-23 \mathrm{~g}_{1}+32 \mathrm{~g}_{2} \in \mathrm{~S} .
\end{aligned}
\end{aligned}
$$

Example 5.4: Let $\mathrm{P}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Z}, 1 \leq \mathrm{i} \leq 3\right.$, $\mathrm{g}_{1}=21$ and $\mathrm{g}_{2}=14$ in $\mathrm{Z}_{28}$. Clearly $\mathrm{g}_{1}^{2}=\mathrm{g}_{1}(\bmod 28)$ and $\left.\mathrm{g}_{2}^{2}=0(\bmod 28) \mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{1}=\mathrm{g}_{2} \mathrm{~g}_{1}(\bmod 28)\right\} . \mathrm{P}$ is a mixed dual number.

Example 5.5: Let $\mathrm{W}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Z}, 1 \leq \mathrm{i} \leq 3\right.$, $\mathrm{g}_{1}=9, \mathrm{~g}_{2}=12 \in \mathrm{Z}_{36}$ are new elements such that $\mathrm{g}_{1}^{2}=\mathrm{g}_{1}(\bmod$ 26) and $\mathrm{g}_{2}^{2}=144=0(\bmod 36)$ and $\left.\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=0(\bmod 36)\right\}$; W is a mixed dual number.

Take $\mathrm{x}=-2+\mathrm{g}_{1}+\mathrm{g}_{2}$ and $\mathrm{y}=5+7 \mathrm{~g}_{1}+10 \mathrm{~g}_{2}$ in W .

$$
\mathrm{x}+\mathrm{y}=3+8 \mathrm{~g}_{1}+11 \mathrm{~g}_{2} .
$$

$$
\mathrm{x} \times \mathrm{y}=\left(-2+\mathrm{g}_{1}+\mathrm{g}_{2}\right) \times\left(5+7 \mathrm{~g}_{1}+10 \mathrm{~g}_{2}\right)
$$

$$
=-10-14 \mathrm{~g}_{1}-20 \mathrm{~g}_{2}+5 \mathrm{~g}_{1}+7 \mathrm{~g}_{1}+0+5 \mathrm{~g}_{2}+0+0
$$

$$
=-10-2 \mathrm{~g}_{1}-15 \mathrm{~g}_{2} \in \mathrm{~W} .
$$

We wish to give structures on these mixed dual numbers.

Let $S=\left\{a+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{C}\right.$ or Z or Q or R or $\mathrm{Z}_{\mathrm{n}}$; $g_{1}^{2}=g_{1}$ and $g_{2}^{2}=0, g_{1} g_{2}=g_{2} g_{1}=g_{1}$ or $g_{2}$ or 0$\}$ be the collection of mixed dual numbers.

S is a general ring of mixed dual numbers denoted by $C\left(g_{1}, g_{2}\right)$ or $Z\left(g_{1}, g_{2}\right)$ or $R\left(g_{1}, g_{2}\right)$ or $Q\left(g_{1}, g_{2}\right)$ or $Z\left(g_{1}, g_{2}\right)$.

Clearly $\mathrm{C}\left(\mathrm{g}_{1}\right) \subseteq \mathrm{C}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ and $\mathrm{C}\left(\mathrm{g}_{1}\right)$ is a two dimensional special dual like number.

Also $\mathrm{C}\left(\mathrm{g}_{2}\right) \subseteq \mathrm{C}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$ and $\mathrm{C}\left(\mathrm{g}_{2}\right)$ is a two dimensional dual number. $\mathrm{C} \subseteq \mathrm{C}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$. The same result is true if C is replaced by $R$ or $Z$ or $Q$ or $Z_{n}$.

We will illustrate this situation by some examples.
Example 5.6: Let $\mathrm{S}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{Q} ; \mathrm{g}_{1}=16\right.$ and $\mathrm{g}_{2}=20$ in $\mathrm{Z}_{40}, \mathrm{~g}_{1}^{2}=16=\mathrm{g}_{1}(\bmod 40)$ and $\mathrm{g}_{2}^{2}=0(\bmod 40)$, $\left.\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=320 \equiv 0(\bmod 40)\right\}$ be a three dimensional mixed dual numbers. $(S,+, \times$ ) is a general ring of three dimensional mixed dual numbers.

Example 5.7: Let $\mathrm{P}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{Z} ; \mathrm{g}_{1}=22\right.$ and $\mathrm{g}_{2}=33 \in \mathrm{Z}_{44}, \mathrm{~g}_{1}^{2}=0(\bmod 44)$ and $\mathrm{g}_{2}^{2}=33(\bmod 44)$, $\left.\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=22(\bmod 44)\right\}$ be the three dimensional mixed dual number general ring.

Example 5.8: Let $\mathrm{T}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{Q}, \mathrm{g}_{1}=12\right.$, $\mathrm{g}_{2}=16 \in \mathrm{Z}_{48} \mathrm{~g}_{1}^{2}=12^{2}=0(\bmod 48)$ and $\mathrm{g}_{2}^{2}=16(\bmod 28)$, $\left.\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=0(\bmod 48)\right\}$ be a three dimensional general ring of mixed dual numbers.

Example 5.9: Let $\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{Z}_{7}, \mathrm{~g}_{1}=13\right.$, $\mathrm{g}_{2}=26 \in \mathrm{Z}_{52}, \mathrm{~g}_{1}^{2}=\mathrm{g}_{1}(\bmod 52)$ and $\mathrm{g}_{2}^{2}=0(\bmod 52)$, $\left.\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=26(\bmod 52)\right\}$ be the three dimensional general ring of mixed dual numbers.

Example 5.10: Let $\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{Z}\right.$; $\mathrm{g}_{1}=30$ and $\mathrm{g}_{2}=40 \in \mathrm{Z}_{60}, \mathrm{~g}_{1}^{2}=0(\bmod 60)$ and $\mathrm{g}_{2}^{2}=40(\bmod 60)$, $\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{1} \mathrm{~g}_{2}=0(\bmod 60\}$ be a general ring of mixed dual numbers.

Example 5.11: Let $\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{R} ; \mathrm{g}_{1}=34\right.$ and $\mathrm{g}_{2}=17 \in \mathrm{Z}_{68}$ we see $\mathrm{g}_{1}^{2}=0(\bmod 68)$ and $\left.\mathrm{g}_{2}^{2}=17(\bmod 68)\right\}$ be the general ring of mixed dual numbers.

Clearly $\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{1}=\mathrm{g}_{2} \mathrm{~g}_{1}(\bmod 68)$; we have several subrings of mixed dual numbers.

Example 5.12: Let $\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{Z}_{20} ; \mathrm{g}_{1}=36\right.$ and $g_{2}=48 \in \mathrm{Z}_{72}$ such that $\mathrm{g}_{2}^{2}=0(\bmod 72), \mathrm{g}_{1}^{2}=0(\bmod 72)$, $\left.\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=0(\bmod 72)\right\}, \mathrm{M}$ is a three dimensional dual number general ring.

Now we proceed onto study the mixed dual numbers generated from $Z_{n}$, where $n=4 m, m$ any composite number.

THEOREM 5.1: Let $Z_{4 m}$ be the ring, $m$ any composite number. $Z_{4 m}$ has element $g_{1}, g_{2}$ such that $g_{1}^{2}=g_{1}(\bmod 4 m)$ and $g_{2}^{2}=0$ $(\bmod 4 m), g_{1} g_{2}=g_{2} g_{1}=0$ or $g_{1}$ or $g_{2}(\bmod 4 m)$. Thus $g_{1}, g_{2}$ contribute to mixed dual number.

The proof is direct by exploiting number theoretic methods hence left as an exercise to the reader.

Example 5.13: Let $\mathrm{S}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq\right.$ $4, \mathrm{~g}_{1}=4, \mathrm{~g}_{2}=6$ and $\mathrm{g}_{3}=9 \in \mathrm{Z}_{12} ; 9^{2}=9(\bmod 12), 6^{2} \equiv 0(\mathrm{mod}$ 12) $4^{2}=4(\bmod 12) 6 \times 9 \equiv 6(\bmod 12), 4 \times 6 \equiv 0(\bmod 12)$, $4 \times 9=0(\bmod 12)\} . S$ is a four dimensional mixed number.

$$
\begin{aligned}
& \text { Let } x=5+3 g_{1}+2 g_{2}-4 g_{3} \text { and } y=6-g_{1}+5 g_{2}+g_{3} \in S, \\
& \qquad x+y=11+2 g_{1}+7 g_{2}-3 g_{3} \in S
\end{aligned}
$$

$$
\begin{aligned}
& \left.\mathrm{x} \times \mathrm{y}=\left(5+3 \mathrm{~g}_{1}+2 \mathrm{~g}_{2}-4 \mathrm{~g}_{3}\right) \times 16-\mathrm{g}_{1}+5 \mathrm{~g}_{2}+\mathrm{g}_{3}\right) \\
& =30+18 \mathrm{~g}_{1}+12 \mathrm{~g}_{2}-24 \mathrm{~g}_{3}-5 \mathrm{~g}_{1}-3 \mathrm{~g}_{1}+0+0+ \\
& 25 \mathrm{~g}_{2}+0+0-20 \mathrm{~g}_{2}+5 \mathrm{~g}_{3}+3 \times 0+2 \mathrm{~g}_{2}-4 \mathrm{~g}_{3} \\
& =30+10 \mathrm{~g}_{1}+19 \mathrm{~g}_{2}-23 \mathrm{~g}_{3} \in \mathrm{~S} .
\end{aligned}
$$

We can have higher dimensional mixed dual number also.
Example 5.14: Let $\mathrm{P}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{R}, 1 \leq \mathrm{i} \leq\right.$ $4, \mathrm{~g}_{1}=16, \mathrm{~g}_{2}=20$ and $\mathrm{g}_{3}=25 \in \mathrm{Z}_{40}, \mathrm{~g}_{1}^{2}=16(\bmod 40), \mathrm{g}_{2}^{2}=0$ $(\bmod 40)$ and $\mathrm{g}_{3}^{2}=25(\bmod 40), \mathrm{g}_{1} \mathrm{~g}_{2}=16 \times 20 \equiv 0(\bmod 40)$, $\left.\mathrm{g}_{1} \times \mathrm{g}_{2}=0(\bmod 40), \mathrm{g}_{2} \times \mathrm{g}_{3}=20 \times 25 \equiv 20(\bmod 40)\right\}$ be a four dimensional mixed dual number.

Example 5.15: Let $\mathrm{S}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3}+\mathrm{a}_{5} \mathrm{~g}_{4} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{R}\right.$, $1 \leq \mathrm{i} \leq 5, \mathrm{~g}_{1}=16, \mathrm{~g}_{2}=20, \mathrm{~g}_{3}=40, \mathrm{~g}_{4}=60 \in \mathrm{Z}_{80}, \mathrm{~g}_{1}^{2}=\mathrm{g}_{1}=16$ $(\bmod 80), \mathrm{g}_{2}^{2}=20^{2}=0(\bmod 80)$ and $\mathrm{g}_{3}^{2}=40^{2}=0(\bmod 80)$ and $\mathrm{g}_{4}^{2}=60^{2}=0(\bmod 80) . \mathrm{g}_{1} \mathrm{~g}_{2}=0(\bmod 80), \mathrm{g}_{2} \mathrm{~g}_{3}=0(\mathrm{mod}$ $80), \mathrm{g}_{1} \mathrm{~g}_{3}=0(\bmod 80), \mathrm{g}_{3} \mathrm{~g}_{4}=0(\bmod 80), \mathrm{g}_{1} \mathrm{~g}_{4}=0(\bmod 80)$, $\left.\mathrm{g}_{2} \mathrm{~g}_{4}=0(\bmod 80)\right\}$ be a five dimensional mixed dual number.

Example 5.16: Let $\mathrm{P}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3}+\mathrm{a}_{5} \mathrm{~g}_{4} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Z}_{19}\right.$, $1 \leq \mathrm{i} \leq 5, \mathrm{~g}_{1}=12, \mathrm{~g}_{2}=16, \mathrm{~g}_{3}=24$ and $\mathrm{g}_{4}=36 \in \mathrm{Z}_{48}, \mathrm{~g}_{1}^{2}=12^{2}=$ $0(\bmod 48), \mathrm{g}_{2}^{2}=16^{2}=16(\bmod 48), \mathrm{g}_{3}^{2}=24^{2}=0(\bmod 48)$ and $\mathrm{g}_{4}^{2}=36^{2}=0(\bmod 48), 12.16 \mathrm{~g}_{1} \mathrm{~g}_{2}=0(\bmod 48), \mathrm{g}_{1} \cdot \mathrm{~g}_{3}=12.24 \equiv$ $0(\bmod 48), \quad \mathrm{g}_{1} \mathrm{~g}_{4}=12.36 \equiv 0(\bmod 48), \mathrm{g}_{2} \mathrm{~g}_{3}=0(\bmod 48)$, $\mathrm{g}_{2} \cdot \mathrm{~g}_{4} \equiv 0(\bmod 48)$ and $\left.\mathrm{g}_{3} \cdot \mathrm{~g}_{4}=0(\bmod 48)\right\}$ be a five dimensional mixed dual number.

Example 5.17: Let us consider $\mathrm{S}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3}+\right.$ $\mathrm{a}_{5} \mathrm{~g}_{4}+\mathrm{a}_{6} \mathrm{~g}_{5} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Q}, 1 \leq \mathrm{i} \leq 6, \mathrm{~g}_{1}=16, \mathrm{~g}_{1}^{2}=16(\bmod 120), \mathrm{g}_{2}=$ $25, g_{2}^{2}=25(\bmod 120), g_{3}=40, g_{3}^{2}=40(\bmod 120) g_{4}=60 g_{4}^{2}$ $=0(\bmod 120), \mathrm{g}_{5}=96, \mathrm{~g}_{5}^{2}=96(\bmod 120)$ belong to $\left.\mathrm{Z}_{120}\right\} . \mathrm{S}$ is a general ring of 6 dimensional mixed dual numbers.

Clearly $g_{1} g_{2} \equiv g_{3}=40(\bmod 120)$.

$$
\begin{aligned}
& \mathrm{g}_{1} \mathrm{~g}_{3}=\mathrm{g}_{3}(\bmod 120) \\
& \mathrm{g}_{1} \times \mathrm{g}_{4}=0(\bmod 120) \\
& \mathrm{g}_{1} \times \mathrm{g}_{5}=\mathrm{g}_{5}(\bmod 120) \\
& \mathrm{g}_{2} \times \mathrm{g}_{3}=\mathrm{g}_{3}(\bmod 120) \\
& \mathrm{g}_{2} \times \mathrm{g}_{4}=\mathrm{g}_{4}(\bmod 120) \\
& \mathrm{g}_{2} \times \mathrm{g}_{5}=0(\bmod 120) \\
& \mathrm{g}_{3} \times \mathrm{g}_{4}=0(\bmod 120) \\
& \mathrm{g}_{3} \times \mathrm{g}_{5}=0(\bmod 120) \text { and } \\
& \mathrm{g}_{4} \times \mathrm{g}_{5}=0(\bmod 120) .
\end{aligned}
$$

Thus $\mathrm{P}=\left\{0, \mathrm{~g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}, \mathrm{~g}_{4}, \mathrm{~g}_{5}\right) \subseteq \mathrm{Z}_{120}$ is a semigroup under product and is defined as the mixed dual number component semigroup of $Z_{120}$.

Example 5.18: Let $\mathrm{S}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3}+\mathrm{a}_{5} \mathrm{~g}_{4}+\mathrm{a}_{6} \mathrm{~g}_{5}+\right.$ $\mathrm{a}_{7} \mathrm{~g}_{6}+\mathrm{a}_{8} \mathrm{~g}_{7}$ with $\mathrm{a}_{\mathrm{i}} \in \mathrm{Q}, 1 \leq \mathrm{i} \leq 9, \mathrm{~g}_{1}=16, \mathrm{~g}_{2}=60, \mathrm{~g}_{3}=96$, $\mathrm{g}_{4}=120, \mathrm{~g}_{5}=160, \mathrm{~g}_{6}=180$ and $\mathrm{g}_{7}=225$ in $\left.\mathrm{Z}_{240}\right\}$ be a general ring of mixed dual numbers of dimension eight.

$$
\begin{aligned}
& \mathrm{g}_{1}^{2}=16^{2}=16(\bmod 240), \\
& \mathrm{g}_{2}^{2}=60^{2}=0(\bmod 240), \\
& \mathrm{g}_{3}^{2}=96^{2}=96(\bmod 240), \\
& \mathrm{g}_{4}^{2}=120^{2}=0(\bmod 240), \\
& \mathrm{g}_{5}^{2}=160^{2}=160(\bmod 240), \\
& \mathrm{g}_{6}^{2}=180^{2}=0(\bmod 240), \\
& \text { and } \mathrm{g}_{7}^{2}=225^{2}=225(\bmod 240), \\
& \\
& \mathrm{g}_{1} \mathrm{~g}_{2}=16 \times 60=0(\bmod 240), \\
& \mathrm{g}_{1} \mathrm{~g}_{3}=16 \times 96=96(\bmod 240), \\
& \mathrm{g}_{1} \mathrm{~g}_{4}=16 \times 120=0(\bmod 240), \\
& \mathrm{g}_{1} \mathrm{~g}_{5}=16 \times 160=160(\bmod 240), \\
& \mathrm{g}_{1} \times \mathrm{g}_{6}=16 \times 180=0(\bmod 240), \\
& \mathrm{g}_{1} \times \mathrm{g}_{7}=16 \times 225=0(\bmod 240), \\
& \mathrm{g}_{2} \times \mathrm{g}_{3}=60 \times 96=0(\bmod 240), \\
& \mathrm{g}_{2} \times \mathrm{g}_{4}=60 \times 120=0(\bmod 240),
\end{aligned}
$$

$$
\begin{aligned}
& g_{2} \times \mathrm{g}_{5}=60 \times 160=0(\bmod 240) \\
& \mathrm{g}_{2} \times \mathrm{g}_{6}=60 \times 180=0(\bmod 240) \\
& \mathrm{g}_{2} \times \mathrm{g}_{7}=60 \times 225=60(\bmod 240) \\
& \mathrm{g}_{3} \times \mathrm{g}_{4}=96 \times 120=0(\bmod 240) \\
& \mathrm{g}_{3} \times \mathrm{g}_{5}=96 \times 160=0(\bmod 240) \\
& \mathrm{g}_{3} \times \mathrm{g}_{6}=96 \times 180=0(\bmod 240), \\
& \mathrm{g}_{3} \times \mathrm{g}_{7}=96 \times 225=0(\bmod 240) \\
& \mathrm{g}_{4} \times \mathrm{g}_{5}=120 \times 160=0(\bmod 240) \\
& \mathrm{g}_{4} \times \mathrm{g}_{6}=120 \times 180=0(\bmod 240) \\
& \mathrm{g}_{4} \times \mathrm{g}_{7}=120 \times 225=120(\bmod 240) \\
& \mathrm{g}_{5} \times \mathrm{g}_{6}=160 \times 180=0(\bmod 240) \\
& \mathrm{g}_{5} \times \mathrm{g}_{7}=160 \times 225=0(\bmod 240) \text { and } \\
& \mathrm{g}_{6} \times \mathrm{g}_{7}=180 \times 225=0(\bmod 240)
\end{aligned}
$$

Thus $\mathrm{P}=\left\{0, \mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{7}\right\} \subseteq \mathrm{Z}_{240}$ is a mixed dual number semigroup component of $\mathrm{Z}_{240}$.

In view of this we propose the following problem.
If $\mathrm{Z}_{\mathrm{n}}\left(\mathrm{n}=\mathrm{p}_{1} \mathrm{p}_{2} \ldots \mathrm{p}_{\mathrm{t}}\right.$ each $\mathrm{p}_{\mathrm{i}}$ 's distinct). Find the cardinality of the mixed dual component semigroup of $Z_{n}$.

Now having seen examples of mixed dual general ring of n-dimension we just proceed to give methods of construction of such rings of any desired dimension. We give a method of constructing any desired dimensional general ring of mixed dual number component semigroup of $Z_{n}$.

Suppose $\mathrm{S}=\left\{0, \mathrm{~g}_{1}, \ldots, \mathrm{~g}_{\mathrm{t}} \mid \mathrm{g}_{1}, \ldots, \mathrm{~g}_{\mathrm{k}}\right.$ are nil potentelements of order two and $g_{k+1}, \ldots, g_{t}$ are idempotents we take $m$ tuples $\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{m}}$ with $\mathrm{x}_{\mathrm{j}}$ 's either all idempotents or all nilpotents of order two in such a way $x_{i}, x_{j}=x_{i}$ if $i=j$ in case $x_{i}$ is an idempotent tuple $x_{i} x_{j}=0$ if $i=j$ in case $x_{j}$ 's are nilpotent of order two $x_{i} \times x_{j}=x_{k}, x_{k}$ is either nilpotent of order two or idempotent if $\mathrm{i} \neq \mathrm{j}\}$.

That is if $x_{i}=\left(g_{1}, \ldots, g_{r}\right)$ and $x_{j}=\left(g_{s}, \ldots, g_{p}\right), 1 \leq r, s, p \leq t$ then $x_{i} x_{j}=x_{k}=\left\{g_{q}, g_{s}, \ldots, g_{1}\right)$ is such that every component in $x_{k}$
is either nilpotent of order two or idempotent 'or' used in the mutually exclusive sense, $1 \leq \mathrm{p}, \mathrm{s}, \ldots, 1 \leq \mathrm{t}$.

We will illustrate this situation by some examples.
Example 5.19: Let $\mathrm{P}=\left\{\mathrm{g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{7}, 0\right\} \subseteq \mathrm{Z}_{240}$ (given in example 5.18).

Consider $\mathrm{x}_{1}=(0,16,0,0,0), \mathrm{x}_{2}=(16,0,0,0,0), \mathrm{x}_{3}=(0,0$, $16,0,0), \mathrm{x}_{4}=(0,0,0,16,0), \mathrm{x}_{5}=(0,0,0,0,16), \mathrm{x}_{6}=(120,0$, $0,0,0,0), \mathrm{x}_{7}=(0,120,0,0,0), \mathrm{x}_{8}=(0,0,120,0,0), \mathrm{x}_{9}=(0,0$, $0,120,0), \mathrm{x}_{10}=(0,0,0,0,120), \mathrm{x}_{11}=(60,0,0,0,0), \mathrm{x}_{12}=(0$, $60,0,0), \mathrm{x}_{13}=(0,0,60,0,0), \mathrm{x}_{14}=(0,0,0,60,0)$ and $\mathrm{x}_{15}=(0$, $0,0,0,60)$.

Using $\mathrm{S}=\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{15},(0,0, \ldots, 0)\right\}$ we can construct a 16 dimensional general ring of mixed dual numbers.

We can also instead of row matrices use the column matrices like

$$
\begin{aligned}
& \mathrm{x}_{1}=\left[\begin{array}{c}
96 \\
0 \\
0 \\
0 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{x}_{2}=\left[\begin{array}{c}
0 \\
96 \\
0 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{x}_{3}=\left[\begin{array}{c}
0 \\
0 \\
96 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{x}_{4}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
96 \\
0 \\
0
\end{array}\right], \mathrm{x}_{5}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
0 \\
96 \\
0
\end{array}\right], \\
& \mathrm{x}_{6}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
0 \\
0 \\
96
\end{array}\right], \mathrm{x}_{7}=\left[\begin{array}{c}
180 \\
0 \\
0 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{x}_{8}=\left[\begin{array}{c}
0 \\
180 \\
0 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{x}_{9}=\left[\begin{array}{c}
0 \\
0 \\
180 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{x}_{10}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
180 \\
0 \\
0
\end{array}\right],
\end{aligned}
$$

$$
\begin{gathered}
\mathrm{x}_{11}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
0 \\
180 \\
0
\end{array}\right], \mathrm{x}_{12}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
0 \\
0 \\
180
\end{array}\right], \mathrm{x}_{13}=\left[\begin{array}{c}
120 \\
0 \\
0 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{x}_{14}=\left[\begin{array}{c}
0 \\
120 \\
0 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{x}_{15}=\left[\begin{array}{c}
0 \\
120 \\
0 \\
0 \\
0
\end{array}\right] \\
\mathrm{x}_{16}=\left[\begin{array}{c}
0 \\
0 \\
120 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{x}_{17}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
120 \\
0
\end{array}\right] \text { and } \mathrm{x}_{18}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
0 \\
0 \\
0 \\
120
\end{array}\right] . \\
\left.\mathrm{U} \operatorname{sing} \mathrm{P}=\left\{\begin{array}{c}
0 \\
0 \\
0 \\
0 \\
0 \\
0
\end{array}\right], x_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{18}\right\}
\end{gathered}
$$

we can construct a general ring of eighteen dimensional mixed dual numbers where

$$
\mathrm{X}_{\mathrm{i}} \times_{\mathrm{n}} \mathrm{X}_{\mathrm{j}}=\left[\begin{array}{c}
0 \\
0 \\
0 \\
0 \\
\mathrm{x} \\
0
\end{array}\right] \text { under the natural product } \times_{\mathrm{n}}
$$

Finally we can find

$$
\begin{aligned}
x_{1}=\left[\begin{array}{ccccc}
120 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0
\end{array}\right], x_{2}= & {\left[\begin{array}{ccccc}
0 & 120 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0
\end{array}\right], \ldots, x_{n} } \\
& =\left[\begin{array}{ccccc}
0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 96
\end{array}\right]
\end{aligned}
$$

using natural product $\times_{\mathrm{n}}$ we can find a n dimensional general ring of mixed dual numbers.

Thus we mainly get mixed dual numbers $\mathrm{Z}_{\mathrm{n}}$.
However we are not aware of getting mixed dual numbers by any other way. We feel if we can find linear operator in $\operatorname{Hom}(V, V)$ such that $T_{i}$ o $T_{i}=T_{i}$ or $O_{T}$, zero operator and if $T_{i}^{2}$ $=T_{i}$ and $T_{j}^{2}=0$ then $T_{i} o T_{j}=T_{j} o T_{i}=0$ or $T_{k}$ where $T_{k}$ is again an idempotent operator or a nilpotent operator of order two. This task is left as an open problem to the reader.

Now having introduced the concept of mixed dual numbers, we proceed onto introduce the notion of fuzzy special dual like numbers and fuzzy mixed dual numbers.

Let $[0,1]$ be the fuzzy interval.
Let $g_{1}$ be a new element such that $g_{1}^{2}=g_{1}$ we call $x=a+b g_{1}$ with $a, b \in[0,1]$ to be a fuzzy special dual like number of dimension two. Clearly if $\mathrm{x}=\mathrm{a}+\mathrm{bg}_{1}$ and $\mathrm{y}=\mathrm{c}+\mathrm{dg}_{1}, \mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}$ $\in[0,1]$ are two fuzzy special dual like numbers then $x+y$ and $\mathrm{x} \times \mathrm{y}$ in general need not be again a fuzzy dual like number for a +c and $\mathrm{bc}+\mathrm{ad}+\mathrm{bd}$ may or may not be in $[0,1]$, we over come this problem by defining min or max of $x, y$.

For if $\mathrm{x}=0.03+0.4 \mathrm{~g}_{1}$ and $\mathrm{y}=0.1+0.7 \mathrm{~g}_{1}$ the $\min (\mathrm{x}, \mathrm{y})=$ $0.03+0.4 \mathrm{~g}$, and max $(\mathrm{x}, \mathrm{y})=0.1+0.7 \mathrm{~g}_{1}$.

Thus if $\mathrm{S}=\left\{\mathrm{a}+\mathrm{bg}_{1} \mid \mathrm{a}, \mathrm{b} \in[0,1]\right.$ and $\mathrm{g}_{1}^{2}=\mathrm{g}_{1}$ is a new element $\}$, then $\{\mathrm{S}, \min \}$ and $\{\mathrm{S}, \max \}$ are general semigroups of dimension two of special dual like number.

We will first illustrate this situation by some examples.
Example 5.20: Let $\mathrm{A}=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{b} \in[0,1] \mathrm{g}=4 \in \mathrm{Z}_{6}\right\}$ be the general semigroup of fuzzy special dual like numbers under $\min$ or max operation of dimension two.

Example 5.21: Let $\mathrm{W}=\left\{\mathrm{x}+\mathrm{yg} \mid \mathrm{x}, \mathrm{y} \in[0,1], \mathrm{g}=4 \in \mathrm{Z}_{12}\right\}$ be the general semigroup of fuzzy special dual like number under max operation of dimension two.

## Example 5.22: Let

$$
M=\left\{x+y g \mid x, y \in[0,1] \text { and } g=\left[\begin{array}{l}
3 \\
4 \\
4 \\
3 \\
4
\end{array}\right] 3,4 \in Z_{6}\right\}
$$

be the general fuzzy semigroup of special dual like number under max operation of dimension two.

Example 5.23: Let

$$
\begin{aligned}
& M=\left\{\left.\left[\begin{array}{l}
a_{1} \\
a_{2} \\
a_{3} \\
a_{4}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { with } x_{i}, y_{i} \in[0,1] ; 1 \leq i \leq 4,\right. \\
& \left.\mathrm{g}=7 \in \mathrm{Z}_{14}\right\}
\end{aligned}
$$

be the general fuzzy semigroup of special dual like number under max operation.

## Example 5.24: Let

$$
\begin{aligned}
P= & \left\{\left.\left[\begin{array}{llll}
a_{1} & a_{2} & a_{3} & a_{4} \\
a_{5} & a_{6} & a_{7} & a_{8} \\
a_{9} & a_{10} & a_{11} & a_{12}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right. \text { with } \\
& \left.x_{i}, y_{i} \in[0,1] ; 1 \leq i \leq 12, g=(7,8,8,7,8) 7,8 \in Z_{14}\right\}
\end{aligned}
$$

be the general fuzzy semigroup of special dual like number under max operation.

## Example 5.25: Let

$$
\begin{aligned}
& \left.S=\left\{\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9} \\
a_{10} & a_{11} & a_{12} \\
a_{13} & a_{14} & a_{15} \\
a_{16} & a_{17} & a_{18}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { with } x_{i}, y_{i} \in[0,1] ; \\
& \left.1 \leq \mathrm{i} \leq 18, \mathrm{~g}=\left[\begin{array}{ccc}
11 & 12 & 0 \\
12 & 11 & 12 \\
12 & 11 & 0 \\
11 & 12 & 11
\end{array}\right] 11,12 \in \mathrm{Z}_{22}\right\}
\end{aligned}
$$

be the general fuzzy semigroup of special dual like number under min operation of dimension two.

Now we proceed onto give examples of higher dimension general fuzzy semigroup of special dual like number.

Example 5.26: Let

$$
\begin{aligned}
& \quad \mathrm{M}=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2}+\mathrm{dg}_{3} \mid \mathrm{a}, \mathrm{~b}, \mathrm{c}, \mathrm{~d} \in[0,1]\right. \\
& \left.\mathrm{g}_{1}=\left[\begin{array}{ccc}
11 & 12 & 11 \\
0 & 11 & 0
\end{array}\right], \mathrm{g}_{2}=\left[\begin{array}{ccc}
12 & 0 & 11 \\
11 & 0 & 12
\end{array}\right] \text { and } \mathrm{g}_{3}=\left[\begin{array}{ccc}
11 & 12 & 0 \\
11 & 0 & 12
\end{array}\right]\right\}
\end{aligned}
$$

be the general fuzzy semigroup of special dual like number of dimension four.

Example 5.27: Let $\mathrm{T}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3}+\mathrm{a}_{5} \mathrm{~g}_{4}+\mathrm{a}_{6} \mathrm{~g}_{5} \mid \mathrm{a}_{\mathrm{i}}\right.$ $\in[0,1] ; 1 \leq \mathrm{i} \leq 6 ; \mathrm{g}_{1}=(13,0,0,14), \mathrm{g}_{2}=(0,13,0,0), \mathrm{g}_{3}=(0$, $0,0,14), \mathrm{g}_{4}=(0,0,13,0)$ and $\mathrm{g}_{5}=(13,0,0,0)$ are idempotents $\left.13,14 \in Z_{26}\right\}$ be the general fuzzy semigroup of special dual like number of dimension six.

Example 5.28: Let

$$
\begin{aligned}
& \left.S=\left\{\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9} \\
a_{10} & a_{11} & a_{12} \\
a_{13} & a_{14} & a_{15}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+x_{5} g_{4} \\
& +\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}, 1 \leq \mathrm{i} \leq 15, \mathrm{x}_{\mathrm{j}} \in[0,1], 1 \leq \mathrm{j} \leq 7,
\end{aligned}
$$

$1 \leq \mathrm{p} \leq 6\}$ be the general fuzzy semigroup of special dual like numbers of dimension seven under max (min) operation.

Example 5.29: Let

$$
T=\left\{\left.\left[\begin{array}{llll}
a_{1} & a_{2} & \ldots & a_{8} \\
a_{9} & a_{10} & \ldots & a_{16}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}\right.
$$

$$
1 \leq \mathrm{i} \leq 16, \mathrm{x}_{\mathrm{s}} \in[0,1], 1 \leq \mathrm{j} \leq 3
$$

be the general fuzzy semigroup of special dual like numbers of dimension three under max operation.

Now we proceed onto give examples of general fuzzy semigroup of mixed dual numbers.

## Example 5.30: Let

$\mathrm{M}=\left\{\mathrm{a}_{1}+\mathrm{b}_{1} \mathrm{~g}_{1}+\mathrm{c}_{1} \mathrm{~g}_{1} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in[0,1] \mathrm{g}_{1}=6\right.$ and $\left.\mathrm{g}_{2}=4 \in \mathrm{Z}_{12}\right\}$ be the general fuzzy semigroup of mixed dual number of dimension three. $g_{1}^{2}=6^{2}=0(\bmod 12)$ and $g_{2}^{2}=4=g_{2}(\bmod$ 12). Finally $\mathrm{g}_{1} \mathrm{~g}_{2}=\mathrm{g}_{2} \mathrm{~g}_{1}=0(\bmod 12)$.

Example 5.31: Let $\mathrm{S}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3} \mid \mathrm{x}_{\mathrm{i}} \in[0,1]\right.$ $1 \leq \mathrm{i} \leq 4 ; \mathrm{g}_{1}=6, \mathrm{~g}_{2}=4, \mathrm{~g}_{3}=9 \in \mathrm{Z}_{12} ; \mathrm{g}_{1}^{2}=6^{2}=0(\bmod 12)$ and $\mathrm{g}_{2}^{2}=4^{2}=\mathrm{g}_{2}(\bmod 12), \mathrm{g}_{3}^{2}=9=\mathrm{g}_{3}(\bmod 12), \mathrm{g}_{1} \mathrm{~g}_{2}=0(\bmod 12)$ $\left.\mathrm{g}_{1} \mathrm{~g}_{3}=69=54=6(\bmod 12), \mathrm{g}_{2} \mathrm{~g}_{3}=4.9=36=0(\bmod 12)\right\}$ be the general fuzzy semigroup of mixed dual number of dimension four under min or max operation.

Example 5.32: Let
$\mathrm{P}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}\right) \mid \mathrm{a}_{\mathrm{i}} \in\langle[0,1] \cup[0, \mathrm{I}]\rangle ; 1 \leq \mathrm{i} \leq 3\right\}$ be a general fuzzy semigroup of neutrosophic special dual like numbers under min or max operation.

## Example 5.33: Let

$$
\left.\left.M=\left\{\begin{array}{cc}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
\vdots & \vdots \\
a_{19} & a_{20}
\end{array}\right] \right\rvert\, a_{i} \in\langle[0, I] \cup[0,1]\rangle ; 1 \leq i \leq 20\right\}
$$

be the general fuzzy semigroup of neutrosophic special dual like numbers under min or max operation.

## Example 5.34: Let

$$
\mathrm{M}=\left\{\left.\left[\begin{array}{cccc}
\mathrm{a}_{1} & \mathrm{a}_{2} & \ldots & a_{16} \\
\mathrm{a}_{17} & a_{18} & \ldots & a_{32}
\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}} \in\langle[0,1] \cup[0, \mathrm{I}]\rangle ; 1 \leq \mathrm{i} \leq 32\right\}
$$

be the general fuzzy semigroup of neutrosophic special dual like numbers under min or max operation.

Thus fuzzy neutrosophic numbers under min or max operation are special dual like numbers.

Finally we see as in case of dual numbers we can in case of special dual like numbers and mixed dual numbers define the notion of natural class of intervals and operations on them to obtain nice algebraic structures.

Example 5.35: Let

$$
\mathrm{R}=\left\{\left.\left[\begin{array}{ll}
\mathrm{a}_{1} & \mathrm{a}_{2} \\
\mathrm{a}_{3} & \mathrm{a}_{4} \\
\mathrm{a}_{5} & \mathrm{a}_{6}
\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}} \in\langle[0, \mathrm{I}] \cup[0,1]\rangle ; 1 \leq \mathrm{i} \leq 6\right\}
$$

be the general fuzzy semigroup of neutrosophic special dual like numbers under min or max operation.

Now we give examples of mixed dual numbers.
Example 5.36: Let $\mathrm{M}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \mathrm{a}_{4}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}, \mathrm{x}_{\mathrm{j}}\right.$ $\in[0,1], 1 \leq \mathrm{i} \leq 4,1 \leq \mathrm{j} \leq 3 \mathrm{~g}_{1}=6$ and $\mathrm{g}_{2}=4 \in \mathrm{Z}_{12} ; \mathrm{g}_{1}^{2}=0$ and $\left.\mathrm{g}_{2}^{2}=12, \mathrm{~g}_{1} \mathrm{~g}_{2}=0(\bmod 12)\right\}$ be the general fuzzy semigroup of mixed dual numbers under min or max operation.

## Example 5.37: Let

$$
\begin{aligned}
& \mathrm{T}=\left\{\begin{array}{l}
\left.\left\{\begin{array}{ccc}
\mathrm{a}_{1} & a_{2} & a_{3} \\
\mathrm{a}_{4} & a_{5} & a_{6} \\
\vdots & \vdots & \vdots \\
\mathrm{a}_{28} & a_{29} & a_{30}
\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3} \text { with } \\
\mathrm{x}_{\mathrm{j}} \in[0,1], 1 \leq \mathrm{i} \leq 30,1 \leq \mathrm{j} \leq 4 ; \mathrm{g}_{1}=6 \text { and } \\
\left.\mathrm{g}_{2}=4 \text { and } \mathrm{g}_{3}=9 \in \mathrm{Z}_{12}\right\}
\end{array}\right.
\end{aligned}
$$

be the general fuzzy semigroup of mixed dual number of dimension four under max or min.

Example 5.38: Let

$$
\begin{gathered}
P=\left\{\left.\left[\begin{array}{cccc}
a_{1} & a_{2} & \ldots & a_{10} \\
a_{11} & a_{12} & \ldots & a_{20}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+\right. \\
x_{5} g_{4}+x_{6} g_{5}+x_{7} g_{6}+x_{8} g_{7}, 1 \leq i \leq 20 \text { with } x_{j} \in[0,1], 1 \leq j \leq 8 ; \\
g_{1}=16 \text { and } g_{2}=60 \text { and } g_{3}=96, g_{4}=120, g_{5}=160, \\
\left.g_{6}=180 \text { and } g_{7}=225 \in Z_{240}\right\}
\end{gathered}
$$

be the general fuzzy semigroup of mixed dual number under max or min of dimension 8 .

Finally just indicate how mixed dual number vector spaces, semivector spaces can be constructed through examples.

Example 5.39: Let

$$
\begin{gathered}
P=\left\{\begin{array}{cc}
{\left.\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
a_{5} & a_{6} \\
a_{7} & a_{8}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2} \text { where } g_{1}=6,}
\end{array}\right. \\
g_{2}=4 \in Z_{12}, x_{j} \in Q ; 1 \leq i \leq 8,1 \leq j \leq 3 ; g_{1}^{2}=0(\bmod 12), \\
\left.g_{2}^{2}=4(\bmod 12) \text { and } g_{1} g_{2}=0(\bmod 12)\right\}
\end{gathered}
$$

be the general vector space of mixed dual numbers over the field Q . Infact M is a general linear algebra of mixed dual numbers over Q under the natural product $\times_{\mathrm{n}}$.

Example 5.40: Let $\mathrm{P}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{15}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\right.$ $4 \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}$ with $\mathrm{x}_{\mathrm{j}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 15,1 \leq \mathrm{j} \leq 7$;

$1 \leq \mathrm{p} \leq 6$ be a vector space / linear algebra of special dual like numbers over the field Q$\}$.

## Example 5.41: Let

$$
\begin{gathered}
S=\left\{\left.\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+4 g_{3}+x_{5} g_{4}+x_{6} g_{5}\right. \\
+x_{7} g_{6}+x_{8} g_{7} \text { with } 1 \leq i \leq 4, x_{j} \in R ; 1 \leq j \leq 8 ; g_{1}=16, \\
g_{2}=60, g_{3}=96, g_{4}=120, g_{5}=160, g_{6}=180 \text { and } \\
g_{7}=225 \text { in } Z_{240} ; g_{2}^{2}=0, g_{1}^{2}=16, g_{3}^{2}=96, g_{4}^{2}=0, \\
\left.g_{5}^{2}=160, g_{6}^{2}=0 \text { and } g_{7}=225\right\}
\end{gathered}
$$

be the general vector space of mixed dual numbers over the field R (or Q ). S is a non commutative linear algebra of mixed dual numbers over R (or Q ) under usual product $\times$ and under $\times_{\mathrm{n}}$; $S$ is a commutative linear algebra of mixed dual numbers over the field.

Study of basis, linear transformation, linear operator, linear functionals, subspaces, dimension, direct sum, pseudo direct sum, eigen values and eigen vectors are a matter of routine hence the reader is expected to derive / describe / define them with appropriate modifications.

## Example 5.42: Let

$$
\begin{aligned}
& M=\left\{\begin{array}{cc}
{\left.\left[\begin{array}{cc}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
\vdots & \vdots \\
a_{21} & a_{22}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}, 1 \leq i \leq 22,} \\
\end{array}\right. \\
& \mathrm{x}_{\mathrm{j}} \in \mathrm{Q} ; 1 \leq \mathrm{j} \leq 4 ; \mathrm{g}_{1}=4, \mathrm{~g}_{2}=6 \text { and } \mathrm{g}_{3}=9 \text { in } \mathrm{Z}_{12} \text { and } \\
& \left.\mathrm{Q}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}\right)=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{4}=\mathrm{a}_{\mathrm{i}}\right\}
\end{aligned}
$$

be a Smarandache general vector space of mixed dual numbers over the Smarandache general ring of mixed dual numbers $Q\left(g_{1}\right.$, $\mathrm{g}_{2}, \mathrm{~g}_{3}$ ).

Clearly M is a S -linear algebra over the S -ring, $\mathrm{Q}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}\right)$ under the natural product $\times_{n}$. Further in general the eigen values and eigen vectors can be mixed dual numbers.

## Example 5.43: Let

$$
\begin{aligned}
& \left.S=\left\{\begin{array}{llll}
a_{1} & a_{2} & \ldots & a_{8} \\
a_{9} & a_{10} & \ldots & a_{16} \\
a_{17} & a_{18} & \ldots & a_{24}
\end{array}\right] \right\rvert\, a_{i} \in Q\left(g_{1}, g_{2}, g_{3}, g_{4}, g_{5}, g_{6}, g_{7}\right), \\
& 1 \leq \mathrm{i} \leq 24, \mathrm{p}=\mathrm{g}_{1}=16, \mathrm{~g}_{2}=60, \mathrm{~g}_{3}=96, \mathrm{~g}_{4}=120, \mathrm{~g}_{5}=160, \\
& \left.\mathrm{~g}_{6}=180, \mathrm{~g}_{7}=225\right\} \subseteq \mathrm{Z}_{240} \text { and } \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3} \\
& \left.+\ldots+\mathrm{x}_{8} \mathrm{~g}_{7} ; 1 \leq \mathrm{i} \leq 8, \mathrm{x}_{\mathrm{j}} \in \mathrm{Q} ; 1 \leq \mathrm{p} \leq 7\right\}
\end{aligned}
$$

be the Smarandache general vector space (S-linear algebra under natural product $\times$ ) of mixed dual numbers over the S-ring, $\mathrm{Q}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{7}\right)$.

We now proceed onto give examples of semivector space of mixed dual numbers.

Example 5.44: Let

$$
\begin{aligned}
& S=\left\{\left.\left[\begin{array}{llll}
a_{1} & a_{2} & a_{3} & a_{4} \\
a_{5} & a_{6} & a_{7} & a_{8}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{2} g_{1}+x_{3} g_{2} ;\right. \\
& \mathrm{x}_{\mathrm{j}} \in \mathrm{Q}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 8,1 \leq \mathrm{j} \leq 3, \mathrm{~g}_{1}=12 \text { and } \mathrm{g}_{2}=16 \text { with } \\
& \left.\mathrm{g}_{1}^{2}=0(\bmod 48), \mathrm{g}_{2}^{2}=16(\bmod 48) \text { in } \mathrm{Z}_{48}\right\}
\end{aligned}
$$

be the general semivector space of mixed dual numbers over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

## Example 5.45: Let

$$
\begin{gathered}
\mathrm{W}=\left\{\begin{array}{c}
\left.\left\{\begin{array}{ccc}
\mathrm{a}_{1} & \mathrm{a}_{2} & a_{3} \\
\mathrm{a}_{4} & a_{5} & a_{6} \\
\vdots & \vdots & \vdots \\
\mathrm{a}_{28} & a_{29} & a_{30}
\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{8} \mathrm{~g}_{7}
\end{array}\right. \\
\text { with } 1 \leq \mathrm{i} \leq 30, \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{j} \leq 8 ; \\
\left.\mathrm{T}=\left\{0, \mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{7}\right\} \subseteq \mathrm{Z}_{240}\right\}
\end{gathered}
$$

be the general semivector space of mixed dual number over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

## Example 5.46: Let

$$
M=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6} \\
a_{7} & a_{8} & a_{9}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}\right.
$$

with $1 \leq \mathrm{i} \leq 9, \mathrm{x}_{\mathrm{j}} \in \mathrm{Q}^{+} \cup\{0\}, 1 \leq \mathrm{j} \leq 4, \mathrm{~g}_{1}=6, \mathrm{~g}_{2}=4$

$$
\text { and } \left.\mathrm{g}_{3}=9 \in \mathrm{Z}_{12}\right\}
$$

be a general S-semivector space of mixed dual numbers over the Smarandache semiring.

$$
\begin{aligned}
& \quad \mathrm{P}=\left\{\left(\mathrm{Q}^{+} \cup\{0\}\right)\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}\right)=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3} \text { with } \mathrm{x}_{\mathrm{j}}\right. \\
& \left.\in \mathrm{Q}^{+} \cup\{0\}, \mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3} \in \mathrm{Z}_{12} \mathrm{~g}_{1}=6, \mathrm{~g}_{2}=4 \text { and } \mathrm{g}_{3}=9\right\} \text {. In this } \\
& \text { case } \mathrm{M} \text { is a Smarandache semilinear algebra over } \mathrm{P} \text {. Further the } \\
& \text { eigen values and eigen vectors associated with any } \mathrm{T}: \mathrm{M} \rightarrow \mathrm{M} \\
& \text { can be mixed dual numbers. }
\end{aligned}
$$

## Example 5.47: Let

$$
\begin{aligned}
& S=\left\{\left.\left[\begin{array}{c}
a_{1} \\
a_{2} \\
\vdots \\
a_{10}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+\ldots+x_{8} g_{7} \text { with } 1 \leq i \leq 10,\right. \\
& \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{11}, 1 \leq \mathrm{j} \leq 8, \mathrm{~g}_{1}=16, \mathrm{~g}_{2}=60, \mathrm{~g}_{3}=96, \mathrm{~g}_{4}=120, \\
& \left.\mathrm{~g}_{6}=160 \text { and } \mathrm{g}_{7}=225 \in \mathrm{Z}_{240}\right\}
\end{aligned}
$$

be the vector space of mixed dual numbers over the field $\mathrm{Z}_{11}$. $S$ is not only finite dimensional but $S$ has only finite number of elements in it.

Example 5.48: Let

$$
S=\left\{\left.\left[\begin{array}{llll}
a_{1} & a_{2} & \ldots & a_{15} \\
a_{16} & a_{17} & \ldots & a_{30}
\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}\right.
$$

with $1 \leq \mathrm{i} \leq 30, \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{25}, 1 \leq \mathrm{j} \leq 4, \mathrm{~g}_{1}=6, \mathrm{~g}_{2}=4$ and

$$
\left.\mathrm{g}_{3}=9 \text { in } \mathrm{Z}_{12}\right\}
$$

be the Smarandache general vector space of mixed dual numbers over the $S$-ring $Z_{25}$.

For all these semivector spaces, semilinear algebras and finite vector spaces of mixed dual numbers we can derive all properties with no difficulty. Thus this task is left as an exercise to the reader.

Now we indicate how intervals of special dual like numbers and mixed dual like numbers are constructed and the algebraic structures defined on them.

Let $\mathrm{N}_{\mathrm{o}}(\mathrm{S})=\left\{\left(\mathrm{a}_{\mathrm{i}}, \mathrm{a}_{\mathrm{j}}\right) \mid \mathrm{a}_{\mathrm{i}}, \mathrm{a}_{\mathrm{j}} \in \mathrm{S}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}\right.\right.$ with $\mathrm{x}_{1}, \mathrm{x}_{2} \in \mathrm{Q}$ ( or Z or $\mathrm{Z}_{\mathrm{n}}$ or R or C ) $\mathrm{g}_{1}^{2}=\mathrm{g}_{1}$ is a new element $\left.\}\right\}$ be the natural class of open intervals with special dual like numbers.

Similarly we can define closed intervals, open-closed intervals and closed-open intervals of special dual like numbers of any dimension.

We will illustrate this situation first by some examples.
Example 5.49: Let $\mathrm{M}=\left\{[\mathrm{a}, \mathrm{b}] \mid \mathrm{a}, \mathrm{b} \in \mathrm{Q}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \mathrm{~g}_{3}\right)=\left\{\mathrm{x}_{1}+\right.\right.$ $\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Q}, 1 \leq \mathrm{i} \leq 4, \mathrm{~g}_{1}=6, \mathrm{~g}_{2}=9$ and $\mathrm{g}_{3}=4 \in$ $\left.\left.\mathrm{Z}_{12}\right\}\right\}$ be the closed interval general ring of mixed dual numbers.

Example 5.50: Let $\mathrm{P}=\{(\mathrm{a}, \mathrm{b}] \mid \mathrm{a}, \mathrm{b} \in\langle\mathrm{R} \cup \mathrm{I}\rangle\}$ be the openclosed intervals general ring of neutrosophic special dual like numbers.

Example 5.51: Let $\mathrm{W}=\left\{[\mathrm{a}, \mathrm{b}) \mid \mathrm{a}, \mathrm{b} \in \mathrm{S}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2} \mid \mathrm{x}_{\mathrm{i}}\right.\right.$ $\left.\left.\in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 3, \mathrm{~g}_{1}=10, \mathrm{~g}_{2}=6 \in \mathrm{Z}_{30}\right\}\right\}$ be the general ring of closed-open interval special dual like numbers of dimension three.

Example 5.52: Let $\mathrm{T}=\left\{(\mathrm{a}, \mathrm{b}) \mid \mathrm{a}, \mathrm{b} \in \mathrm{S}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\right.\right.$ $\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6} \mid \mathrm{x}_{\mathrm{j}} \in \mathrm{R}, 1 \leq \mathrm{j} \leq 7$,

$1 \leq \mathrm{k} \leq 6\}\}$ be the seven dimensional open interval general ring of special dual like numbers.

Example 5.53: Let $\mathrm{P}=\left\{[\mathrm{a}, \mathrm{b}) \mid \mathrm{a}, \mathrm{b} \in \mathrm{S}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\right.\right.$ $\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}$ where $\mathrm{g}_{1}=16, \mathrm{~g}_{2}=96, \mathrm{~g}_{3}=160, \mathrm{~g}_{4}=225 \in \mathrm{Z}_{240}, \mathrm{x}_{\mathrm{i}}$ $\in Z, 1 \leq i \leq 5\}\}$ be the closed-open interval general ring of special dual like numbers.

Example 5.54: Let $\mathrm{M}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{\mathrm{n}}\right) \mid \mathrm{a}_{\mathrm{i}}=\left[\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}}\right]\right.$ where $\mathrm{x}_{\mathrm{i}}$, $y_{i} \in S=\left\{x_{1}+x_{2} g_{1}+x_{3} g_{2} \mid x_{1}, x_{2}, x_{3} \in Q\right.$,

$1 \leq \mathrm{i} \leq \mathrm{n}\}\}$ be the closed $0_{\text {interval }}$ row matrix general ring of special dual like numbers.

Example 5.55: Let

$$
\begin{gathered}
P=\left\{\begin{array}{cc}
{\left.\left[\begin{array}{cc}
a_{1} & a_{2} \\
a_{3} & a_{4} \\
\vdots & \vdots \\
a_{11} & a_{12}
\end{array}\right] \right\rvert\, a_{i}=\left(c_{i}, d_{i}\right] \text { with } c_{i}, d_{i} \in S=\left\{x_{1}+x_{2} g_{1}+\right.} \\
x_{3} g_{2}+x_{4} g_{3}+x_{5} g_{4} \mid x_{j} \in Q, 1 \leq j \leq 4, g_{1}=16, g_{2}=96, \\
\left.\left.g_{3}=160 \text { and } g_{4}=225 \in Z_{240}\right\} 1 \leq i \leq 12\right\}
\end{array}, \begin{array}{l}
120
\end{array}\right)
\end{gathered}
$$

be the open-closed interval column matrix general ring of special dual like numbers.

Example 5.56: Let

$$
\begin{gathered}
B=\left\{\left.\left[\begin{array}{ll}
a_{1} & a_{2} \\
a_{3} & a_{4}
\end{array}\right] \right\rvert\, a_{i}=[c, d] \text { with } c, d \in S\right. \\
=\left\{x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3} \mid x_{t} \in Q, 1 \leq t \leq 4,\right.
\end{gathered}
$$

$1 \leq \mathrm{j} \leq 3\}\}$ be the closed interval square matrix general non commutative ring of special dual like numbers.

## Example 5.57: Let

$$
\begin{gathered}
S=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{i}=\left(d_{i}, c_{i}\right], d_{i}, c_{i} \in P=\left\{x_{1}+x_{2} g_{1}+x_{3} g_{2}+\right.\right. \\
x_{4} g_{3}+x_{5} g_{4}+x_{6} g_{5}+x_{7} g_{6} \text { where } x_{j} \in Q, 1 \leq j \leq 7 \text { and }
\end{gathered}
$$

$1 \leq \mathrm{p} \leq 6\}\}$ be the open-closed interval general polynomial ring of special dual like numbers.

These interval rings has zero divisors, units, idempotents, subrings and ideals. All properties can be derived which is a matter of routine.

Example 5.58: Let

$$
\begin{aligned}
T=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{i}=\right. & (c, d], c, d \in S= \\
& \left\{x_{1}+x_{2} g_{1}+\ldots+x_{12} g_{11} \mid x_{j} \in Z\right.
\end{aligned}
$$

$1 \leq \mathrm{j} \leq 12$ and $1 \leq \mathrm{p} \leq 11\}\}$ be the closed-open interval coefficient polynomial general ring of special dual like numbers.

Example 5.59: Let $\mathrm{S}=\left\{[\mathrm{a}, \mathrm{b}) \mid \mathrm{a}, \mathrm{b} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\right.\right.$ $\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 5$,

$1 \leq \mathrm{j} \leq 4\}\}$ be the closed open-interval general semiring of special dual like numbers.

Clearly S is not a semifield.
Example 5.60: Let $\mathrm{S}=\left\{(\mathrm{a}, \mathrm{b}) \mid \mathrm{a}, \mathrm{b} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\right.\right.$ $\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}, \mathrm{g}_{1}=16, \mathrm{~g}_{2}=120, \mathrm{~g}_{3}=96$ and $\mathrm{g}_{4}=$
$\left.\left.225 \in \mathrm{Z}_{240}, 1 \leq \mathrm{i} \leq 5\right\}\right\}$ be the open interval general semiring of special dual like numbers.

Example 5.61: Let $\mathrm{S}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \mathrm{a}_{4}\right) \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\right.\right.$ $\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}, 1 \leq \mathrm{j} \leq 6$,

where $1 \leq \mathrm{p} \leq 6\}\}$ be the interval row matrix general semiring of special dual like numbers.

Clearly M is not a semifield only a smarandache semiring.

## Example 5.62: Let

$$
\begin{aligned}
& T=\left\{\begin{array}{c}
{\left.\left[\begin{array}{c}
a_{1} \\
a_{2} \\
\vdots \\
a_{9}
\end{array}\right] \right\rvert\, a_{i}=[c, d] ; c, d \in S=\left\{x_{1}+x_{2} g_{1}+x_{3} g_{2} \mid x_{j} \in\right\}}
\end{array}\right. \\
& \left.\left.\mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{j} \leq 3 \text { and } \mathrm{g}_{1}=6, \mathrm{~g}_{2}=10 \in \mathrm{Z}_{30}\right\}, 1 \leq \mathrm{i} \leq 9\right\}
\end{aligned}
$$

be the column interval matrix semiring of special dual like numbers.

Example 5.63: Let $T=\left\{\left.\left[\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9}\end{array}\right] \right\rvert\,\right.$ where $a_{j}=[c, d] ; c, d$ $\in \mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\ldots+\mathrm{x}_{16} \mathrm{~g}_{15}\right.$ where $\mathrm{g}_{\mathrm{t}}$ be elements of a chain lattice with 17 elements $x_{i} \in \mathrm{Z}^{+} \cup\{0\} ; 1 \leq \mathrm{i}$ $\leq 16,1 \leq \mathrm{t} \leq 15\}, 1 \leq \mathrm{j} \leq 9\}$ be a closed square interval matrix general semiring of special dual like numbers. W is a non commutative semiring under usual product $\times$ of matrices where as a commutative ring under the natural product $x_{n}$ of matrices.

Example 5.64: Let

$$
\begin{aligned}
& M=\left\{\left.\left[\begin{array}{llll}
a_{1} & a_{2} & \ldots & a_{10} \\
a_{11} & a_{12} & \ldots & a_{20} \\
a_{21} & a_{22} & \ldots & a_{30}
\end{array}\right] \right\rvert\, a_{i}=(c, d] ; c, d \in S=\left\{x_{1}+x_{2} g_{1}+\right.\right. \\
& \mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4} \mid \mathrm{x}_{\mathrm{j}} \in \mathrm{R}^{+} \cup\{0\} ; 1 \leq \mathrm{j} \leq 5, \mathrm{~g}_{1}=16, \\
& \left.\left.\mathrm{~g}_{2}=96, \mathrm{~g}_{3}=160 \text { and } \mathrm{g}_{4}=225 \in \mathrm{Z}_{240}\right\} ; 1 \leq \mathrm{i} \leq 30\right\}
\end{aligned}
$$

be the rectangular matrix of open-closed interval general semiring of special dual like numbers. Clearly the usual product of matrices cannot be defined on M . M is not a semifield has zero divisors.

Example 5.65: Let $\mathrm{S}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}}=(\mathrm{c}, \mathrm{d}], \mathrm{c}, \mathrm{d} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\right.\right.$ $\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{18} \mathrm{~g}_{17} \mid \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{j} \leq 18$ and $\mathrm{g}_{\mathrm{p}}$ are elements of chain lattice of order $19,1 \leq \mathrm{p} \leq 17\}\}$ be the closed interval coefficient polynomial semiring of special dual like numbers.

Example 5.66: Let $\mathrm{M}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \ldots, \mathrm{a}_{10}\right) \mid \mathrm{a}_{\mathrm{i}}=[\mathrm{c}, \mathrm{d}) ; \mathrm{c}, \mathrm{d} \in \mathrm{S}\right.$ $=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4} \mid \mathrm{x}_{\mathrm{j}} \in \mathrm{Q}, 1 \leq \mathrm{j} \leq 5, \mathrm{~g}_{1}=16 \mathrm{~g}_{2}=\right.$ $96, \mathrm{~g}_{3}=160$, and $\left.\left.\mathrm{g}_{4}=225 \in \mathrm{Z}_{240}\right\}, 1 \leq \mathrm{i} \leq 10\right\}$ be the interval
row matrix general vector space of special dual like numbers over the field Q .

Likewise we can define interval column matrix general vector space / linear algebra of special dual like numbers, interval rectangular matrix general vector space / linear algebra of special dual like numbers and interval matrix general vector space/ linear algebra of special dual like numbers.

The reader is expected to give examples of all these cases.

## Example 5.67: Let

$$
\begin{gathered}
T=\left\{\left.\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
a_{4} & a_{5} & a_{6}
\end{array}\right] \right\rvert\, a_{i}=(c, d] ; c, d \in S=\left\{x_{1}+x_{2} g_{1}+\right.\right. \\
\left.\left.x_{3} g_{2} \mid x_{j} \in Z^{+} \cup\{0\} ; 1 \leq j \leq 3, g_{1}=6, g_{2}=10 \in Z_{30}\right\}\right\}
\end{gathered}
$$

be the closed open interval general semivector space of special dual like numbers over the semifield $\mathrm{Z}^{+} \cup\{0\}$.

Likewise semivector spaces of row matrices, column matrices and square matrices with interval entries can be constructed. This task is also left to the reader.

$+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{20} \mathrm{~g}_{19} \mid \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{150}, 11 \leq \mathrm{j} \leq 20, \mathrm{~g}_{\mathrm{p}} \in \mathrm{L}, \mathrm{L}$ a chain lattice of order $21,1 \leq \mathrm{p} \leq 19\}, 1 \leq \mathrm{i} \leq 18\}$ be a Smarandache vector space rectangular matrix of intervals of special dual like numbers over the S -ring $\mathrm{Z}_{150}$.

Example 5.69: Let $P=\left\{\left.\left[\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9}\end{array}\right] \right\rvert\,\right.$ where $a_{j}=[c, d] ; c, d$
$\in S=\left\{x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+x_{5} g_{4} \mid x_{j} \in Z_{19}, 1 \leq j \leq 5, g_{1}=16\right.$, $\mathrm{g}_{2}=96, \mathrm{~g}_{3}=160$ and $\left.\left.\mathrm{g}_{4}=225 \in \mathrm{Z}_{240}\right\}, 1 \leq \mathrm{i} \leq 9\right\}$ be a square matrix with closed intervals entries. P is a general vector space of special dual like numbers over the field $\mathrm{Z}_{19}$.

Now we can also construct intervals of mixed dual numbers. This is also considered as a matter of routine. So we only give some examples so that interested reader can work in this direction.

Example 5.70: Let $\mathrm{W}=\left\{[\mathrm{a}, \mathrm{b}] \mid \mathrm{a}, \mathrm{b} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\right.\right.$ $\ldots+\mathrm{x}_{8} \mathrm{~g}_{7} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Q}, \mathrm{g}_{1}=16, \mathrm{~g}_{2}=60, \mathrm{~g}_{3}=96, \mathrm{~g}_{4}=160, \mathrm{~g}_{5}=180$ and $\mathrm{g}_{6}=120$ and $\left.\left.\mathrm{g}_{7}=225 \in \mathrm{Z}_{240}\right\}\right\}$. W is a general ring of natural class of closed intervals of mixed dual numbers.

Example 5.71: Let $\mathrm{S}=\left\{(\mathrm{a}, \mathrm{b}] \mid \mathrm{a}, \mathrm{b} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\right.\right.$ $\mathrm{X}_{20} \mathrm{~g}_{19} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{R}, 1 \leq \mathrm{i} \leq 20, \mathrm{~g}_{\mathrm{p}} \in \mathrm{L}, \mathrm{L}$ a chain lattice of order 21,

$1 \leq \mathrm{p} \leq 19\}\}$ be the general ring of open-closed intervals of special dual numbers.

Using chain lattices or distributive lattices one cannot construct mixed dual numbers.

Example 5.72: Let $\mathrm{M}=\left\{(\mathrm{a}, \mathrm{b}) \mid \mathrm{a}, \mathrm{b} \in \mathrm{S}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\right.\right.$ $\mathrm{x}_{4} \mathrm{~g}_{3} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Q}, 1 \leq \mathrm{i} \leq 4$ and $\mathrm{g}_{1}=6, \mathrm{~g}_{2}=4$ and $\left.\left.\mathrm{g}_{3}=9 \in \mathrm{Z}_{12}\right\}\right\}$ be the general ring of open intervals of mixed dual numbers.

Example 5.73: Let $\mathrm{S}=\left\{(\mathrm{a}, \mathrm{b}] \mid \mathrm{a}, \mathrm{b} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\right.\right.$ $\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}+\mathrm{x}_{8} \mathrm{~g}_{7} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}_{200}, 1 \leq \mathrm{i} \leq 8$ and $\mathrm{g}_{1}=16$, $\mathrm{g}_{2}=60, \mathrm{~g}_{3}=120, \mathrm{~g}_{4}=96, \mathrm{~g}_{5}=160, \mathrm{~g}_{7}=180$ and $\mathrm{g}_{6}=225 \in$ $\left.\left.\mathrm{Z}_{240}\right\}\right\}$ be the open-closed interval general ring of mixed dual numbers.

Example 5.74: Let $\mathrm{S}=\left\{(\mathrm{a}, \mathrm{b}) \mid \mathrm{a}, \mathrm{b} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2} \mid \mathrm{x}_{\mathrm{i}}\right.\right.$ $\in \mathrm{Z}, 1 \leq \mathrm{i} \leq 3, \mathrm{~g}_{1}=6$ and $\left.\left.\mathrm{g}_{2}=4 \in \mathrm{Z}_{12}\right\}\right\}$ be the open interval general ring of mixed dual numbers.

$$
\begin{aligned}
& \text { Let } \mathrm{x}=\left(3+5 \mathrm{~g}_{1}+\mathrm{g}_{2}, 7 \mathrm{~g}_{2}+5\right) \text { and } \mathrm{y}=\left(-7+8 \mathrm{~g}_{2}, 5+\mathrm{g}_{1}+3 \mathrm{~g}_{2}\right) \in \mathrm{S} \\
& \text { Now } \mathrm{x}+\mathrm{y}=\left(-4+5 \mathrm{~g}_{1}+9 \mathrm{~g}_{2}, 10+\mathrm{g}_{1}+10 \mathrm{~g}_{2}\right) \in \mathrm{S} ; \\
& \mathrm{x} \times \mathrm{y}=\left(\left(3+5 \mathrm{~g}_{1}+\mathrm{g}_{2}\right) \times\left(-7+8 \mathrm{~g}_{2}\right),\left(7 \mathrm{~g}_{2}+5\right)\left(5+\mathrm{g}_{1}+3 \mathrm{~g}_{2}\right)\right. \\
& =\left(-21-35 \mathrm{~g}_{1}-7 \mathrm{~g}_{2}+24 \mathrm{~g}_{2}+40 \mathrm{~g}_{1} \mathrm{~g}_{2}+8 \mathrm{~g}_{2}^{2}+35 \mathrm{~g}_{2}+\right. \\
& \left.25+7 \mathrm{~g}_{1} \mathrm{~g}_{2}+5 \mathrm{~g}_{1}+21 \mathrm{~g}_{2}^{2}+15 \mathrm{~g}_{2}\right) \\
& =\left(-21-35 \mathrm{~g}_{1}+25 \mathrm{~g}_{2}, 25+5 \mathrm{~g}_{1}+71 \mathrm{~g}_{2}\right) \\
& \quad\left(\because \mathrm{g}_{2}^{2}=\mathrm{g}_{2} \text { and } \mathrm{g}_{1} \mathrm{~g}_{2}=0\right)
\end{aligned}
$$

$x \times y \in S$. This is the way operations ' + ' and ' $x$ ' are performed on $S$
Example 5.75: Let $\mathrm{S}=\left\{\begin{array}{l}{\left.\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3} \\ a_{4}\end{array}\right] \right\rvert\, a_{i}=(c, d) ; c, d \in P=\left\{x_{1}+x_{2} g_{1}\right\}}\end{array}\right.$
$+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}_{7} ; 1 \leq \mathrm{i} \leq 5, \mathrm{~g}_{1}=12, \mathrm{~g}_{2}=16, \mathrm{~g}_{3}=24$, $\left.\left.\mathrm{g}_{4}=36 \in \mathrm{Z}_{48}\right\}, 1 \leq \mathrm{j} \leq 4\right\}$ be the general ring of open interval matrices of mixed dual number.

Clearly cardinality of S is finite.
Example 5.76: Let $\mathrm{S}=\left\{\left.\left[\begin{array}{lllll}\mathrm{a}_{1} & \mathrm{a}_{2} & \mathrm{a}_{3} & \mathrm{a}_{4} & \mathrm{a}_{5} \\ \mathrm{a}_{6} & \mathrm{a}_{7} & \mathrm{a}_{8} & \mathrm{a}_{9} & \mathrm{a}_{10}\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{j}}=[\mathrm{c}, \mathrm{d})\right.$;
c, $d \in S=\left\{x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3} \mid x_{i} \in Q ; 1 \leq i \leq 4, g_{1}=(6,6\right.$, $\left.\left.6), \mathrm{g}_{2}=(4,4,4), \mathrm{g}_{3}=(9,9,9), 4,6,9 \in \mathrm{Z}_{12}\right\} 1 \leq \mathrm{j} \leq 10\right\}$ be the closed - open interval matrix ring of mixed dual number.

Example 5.77: Let $\mathrm{W}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}\right) \mid \mathrm{a}_{\mathrm{j}}=(\mathrm{c}, \mathrm{d}] ; \mathrm{c}, \mathrm{d} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\right.\right.$ $\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}_{5} ; 1 \leq \mathrm{i} \leq 3$ and $\mathrm{g}_{1}=14$ and $\left.\mathrm{g}_{2}=21 \in \mathrm{Z}_{28}\right\}, 1$ $\leq \mathrm{j} \leq 2\}$ be the open-closed interval general ring of mixed dual numbers.

Example 5.78: Let $\mathrm{T}=\left\{\begin{array}{ccc}{\left.\left[\begin{array}{ccc}\mathrm{a}_{1} & a_{2} & a_{3} \\ \mathrm{a}_{4} & \mathrm{a}_{5} & \mathrm{a}_{6} \\ \vdots & \vdots & \vdots \\ \mathrm{a}_{28} & \mathrm{a}_{29} & \mathrm{a}_{30}\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{j}}=[\mathrm{c}, \mathrm{d}] ; 1 \leq \mathrm{i} \leq} \\ \end{array}\right.$ 30, c, d $\in P=\left\{x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+\ldots+x_{8} g_{7} \mid \quad x_{i} \in R\right.$; $1 \leq \mathrm{j} \leq 8, \mathrm{~g}_{1}=16, \mathrm{~g}_{2}=60, \mathrm{~g}_{3}=96, \mathrm{~g}_{4}=120, \mathrm{~g}_{5}=160, \mathrm{~g}_{6}=180$ and $\left.\left.\mathrm{g}_{7}=225 \in \mathrm{Z}_{240}\right\}, 1 \leq \mathrm{i} \leq 30\right\}$ be the closed-open interval general ring of $10 \times 3$ matrices of mixed dual numbers.

Example 5.79: Let $\mathrm{L}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}\right) \mid \mathrm{a}_{\mathrm{j}}=(\mathrm{c}, \mathrm{d}] ; \mathrm{c}, \mathrm{d} \in\left\{\mathrm{x}_{1}+\right.\right.$ $\left.\left.\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}_{6} ; 1 \leq \mathrm{i} \leq 3, \mathrm{~g}_{1}=6, \mathrm{~g}_{2}=4 \in \mathrm{Z}_{12}\right\} ; 1 \leq \mathrm{j} \leq 3\right\}$ be the open-closed interval general ring of mixed dual numbers.

$$
\begin{aligned}
& \text { Let } \mathrm{x}=\left(\left(3+2 \mathrm{~g}_{1}+\mathrm{g}_{1}+3 \mathrm{~g}_{2}\right],\left(4+5 \mathrm{~g}_{2}, \mathrm{~g}_{1}+4\right],\right. \\
& \qquad \begin{array}{c}
\left.\left(3 \mathrm{~g}_{1}+\mathrm{g}_{2}, 3 \mathrm{~g}_{2}+4 \mathrm{~g}_{1}+1\right]\right) \text { and } \\
\mathrm{y}=\left(\left(2+\mathrm{g}_{1}, \mathrm{~g}_{2}+4\right],\left(3 \mathrm{~g}_{1}+\mathrm{g}_{2}, \mathrm{~g}_{2}\right],\left(0,4 \mathrm{~g}_{1}\right]\right) \text { be in } \mathrm{L} . \\
\mathrm{x}+\mathrm{y}=\left[\left(5+3 \mathrm{~g}_{1}+\mathrm{g}_{2}, \mathrm{~g}_{1}+4 \mathrm{~g}_{2}+4\right],\left(4+3 \mathrm{~g}_{1}, \mathrm{~g}_{1}+\mathrm{g}_{2}+\right.\right. \\
\left.4],\left(3 \mathrm{~g}_{1}+\mathrm{g}_{2}, 1+3 \mathrm{~g}_{2}+3 \mathrm{~g}_{1}\right]\right) \in \mathrm{L}
\end{array}
\end{aligned}
$$

$$
\begin{gathered}
\mathrm{x} \times \mathrm{y}=\left(\left(3+2 \mathrm{~g}_{1}+\mathrm{g}_{2}, \mathrm{~g}_{1}+3 \mathrm{~g}_{2}\right] \times\left(2+\mathrm{g}_{1}, \mathrm{~g}_{2}+4\right],\right. \\
\left(4+5 \mathrm{~g}_{2}, \mathrm{~g}_{1}+4\right]\left(3 \mathrm{~g}_{1}+\mathrm{g}_{2}, \mathrm{~g}_{2}\right], \\
\left.\left(3 \mathrm{~g}_{1}+\mathrm{g}_{2}, 3 \mathrm{~g}_{2}+4 \mathrm{~g}_{1}+1\right]\left(0,4 \mathrm{~g}_{1}\right]\right) \\
=\left(\left(6+3 \mathrm{~g}_{1}+2 \mathrm{~g}_{1}^{2}+2 \mathrm{~g}_{1}+{\mathrm{g} 1 \mathrm{~g}_{2}, \mathrm{~g}_{1} \mathrm{~g}_{2}+4 \mathrm{~g}_{1}+}^{\left.3 \mathrm{~g}_{2}^{2}+12 \mathrm{~g}_{2}\right],\left(12 \mathrm{~g}_{1}+42+15 \mathrm{~g}_{1} \mathrm{~g}_{2}+\right.}\right.\right. \\
\left.5 \mathrm{~g}_{2}^{2}, \mathrm{~g}_{1} \mathrm{~g}_{2}+4 \mathrm{~g}_{2}\right],\left(0,12 \mathrm{~g}_{1} \mathrm{~g}_{2}+\right. \\
\left.\left.16 \mathrm{~g}_{1}^{2}+4 \mathrm{~g}_{1}\right]\right) \\
=\left(6+3 \mathrm{~g}_{1}, 4 \mathrm{~g}_{1}+3 \mathrm{~g}_{2}\right],\left(2 \mathrm{~g}_{1}+3 \mathrm{~g}_{2}, 4 \mathrm{~g}_{2}\right], \\
\left.\left(0,4 \mathrm{~g}_{1}\right]\right) \in \mathrm{L} .
\end{gathered}
$$

Thus L is a ring.
Example 5.80: Let $\mathrm{S}=\left\{[\mathrm{a}, \mathrm{b}] \mid \mathrm{a}, \mathrm{b} \in \mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\right.\right.$ $\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 5, \mathrm{~g}_{1}=12, \mathrm{~g}_{2}=16, \mathrm{~g}_{3}=24$, $\left.\left.\mathrm{g}_{4}=36 \in \mathrm{Z}_{48}\right\}\right\}$ be the closed interval general semiring of mixed dual numbers.

Example 5.81: Let $\mathrm{M}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}\right) \mid \mathrm{a}_{\mathrm{i}}=[\mathrm{c}, \mathrm{d}), \mathrm{c}, \mathrm{d} \in \mathrm{S}=\left\{\mathrm{x}_{1}+\right.\right.$ $\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5} \mid \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{j} \leq 6, \mathrm{~g}_{\mathrm{p}} \in \mathrm{L}$ $=$ a chain lattice of order seven $1 \leq \mathrm{p} \leq 5\}, 1 \leq \mathrm{i} \leq 2\}$ be the closed open interval general semiring of mixed dual numbers.

## Example 5.82: Let

$$
\begin{gathered}
T=\left\{\left.\left[\begin{array}{llll}
a_{1} & a_{2} & \ldots & a_{8} \\
a_{9} & a_{10} & \ldots & a_{16}
\end{array}\right] \right\rvert\, a_{i}=[c, d), c, d \in S=\left\{x_{1}+x_{2} g_{1}+\right.\right. \\
x_{3} g_{2}+x_{4} g_{3}+x_{5} g_{4}+x_{6} g_{5}+x_{7} g_{6}+x_{8} g_{7} \text { with } x_{j} \in Q^{+} \cup\{0\}, \\
1 \leq j \leq 8, g_{1}=16, g_{2}=60, g_{3}=96, g_{4}=120, g_{5}=160, \\
\left.\left.g_{6}=180, \text { and } g_{7}=225 \in Z_{240}\right\}, 1 \leq i \leq 16\right\}
\end{gathered}
$$

be the open-closed interval rectangular matrix of semiring of mixed dual numbers. Clearly T is not a semfield of mixed dual numbers.

Now we see we can build as in case of special dual like numbers in case of mixed dual numbers also vector spaces and semivector spaces / linear algebra of intervals. This work is left for the reader, however we give problems in this regard in the last chapter of this book.

Finally we can have fuzzy interval mixed dual numbers and fuzzy interval special dual like numbers and they are fuzzy semigroups under max or min operations.

We will illustrate this situation by some examples.
Example 5.83: Let $\mathrm{S}=\left\{[\mathrm{a}, \mathrm{b}) \mid \mathrm{a}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}\right.$ and $\mathrm{b}=\mathrm{y}_{1}$ $+y_{2} g_{1}+y_{3} g_{2}$ where $\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{j}} \in[0,1], 1 \leq \mathrm{i}, \mathrm{j} \leq 3, \mathrm{~g}_{1}=6$ and $\mathrm{g}_{2}=4$ $\left.\in \mathrm{Z}_{12}\right\}$ be the closed-open interval fuzzy semigroup of mixed dual number under max or min operation.

Example 5.84: Let
$\mathrm{M}=\left\{(\mathrm{a}, \mathrm{b}) \mid \mathrm{a}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}\right.$ and

$$
\mathrm{B}=\mathrm{y}_{1}+\mathrm{y}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{y}_{7} \mathrm{~g}_{6} \text { where } \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{j}} \in[0,1], 1 \leq \mathrm{i}, \mathrm{j} \leq 7
$$

and

$1 \leq \mathrm{p} \leq 6\}\}$ be the open interval fuzzy semigroup of special dual like numbers under min (or max) operator.

Example 5.85: Let $\mathrm{S}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \mathrm{a}_{4}\right) \mid \mathrm{a}_{\mathrm{i}}=[\mathrm{c}, \mathrm{d}], \mathrm{c}, \mathrm{d} \in \mathrm{P}=\right.$ $\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{9} \mathrm{~g}_{8} \mid \mathrm{x}_{\mathrm{j}} \in[0,1], 1 \leq \mathrm{j} \leq 9\right.$ and $\mathrm{g}_{\mathrm{p}} \in \mathrm{L}$; L a chain lattice of order 10 given by $\mathrm{L}=\left\{1>\mathrm{g}_{1}>\mathrm{g}_{2}>\ldots>\mathrm{g}_{8}>0\right\}$, $1 \leq \mathrm{p} \leq 8\}, 1 \leq \mathrm{i} \leq 4\}$ be the closed interval general fuzzy semigroup of special dual like numbers under min or max operation.

Example 5.86: Let $\mathrm{W}=\left\{\begin{array}{c}{\left.\left[\begin{array}{c}a_{1} \\ a_{2} \\ \vdots \\ a_{10}\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=[\mathrm{c}, \mathrm{d}), \mathrm{c}, \mathrm{d} \in \mathrm{S}=\left\{\mathrm{x}_{1}+\right.} \\ \end{array}\right.$
$\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3} \mid \mathrm{x}_{\mathrm{j}} \in[0,1], 1 \leq \mathrm{j} \leq 4$ and $\mathrm{g}_{1}=6, \mathrm{~g}_{2}=4$ and $\mathrm{g}_{3}$ $\left.\left.=9 \in \mathrm{Z}_{12}\right\} ; 1 \leq \mathrm{i} \leq 10\right\}$ be the closed open interval general fuzzy semigroup of mixed dual numbers for in $x \times y=\min \{x, y\}$, we take $\min \left\{\mathrm{x}_{1}, \mathrm{y}_{1}\right\}+\min \left\{\mathrm{x}_{2}, \mathrm{y}_{2}\right\} \mathrm{g}_{1}^{2}+\min \left\{\mathrm{x}_{3} \mathrm{y}_{3}\right\} \mathrm{g}_{2}^{2}+\ldots+$ $\min \left\{\mathrm{x}_{2}, \mathrm{y}_{3}\right\} \mathrm{g}_{1} \times \mathrm{g}_{2}$ and so on be it min or max operation we take only $\mathrm{g}_{\mathrm{i}} \mathrm{g}_{\mathrm{j}}$ (product modulo 12), $1 \leq \mathrm{i}, \mathrm{j} \leq 3$.

Example 5.87: Let $\mathrm{P}=\left\{\left.\left[\begin{array}{cccc}\mathrm{a}_{1} & \mathrm{a}_{2} & \ldots & a_{12} \\ \mathrm{a}_{13} & a_{14} & \ldots & a_{24} \\ \mathrm{a}_{25} & \mathrm{a}_{26} & \ldots & a_{36}\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=(\mathrm{c}, \mathrm{d}], \mathrm{c}, \mathrm{d}\right.$
$\in\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}+\mathrm{x}_{8} \mathrm{~g}_{7 \mathrm{v}}\right.$ with $\mathrm{x}_{\mathrm{j}} \in$ $[0,1], 1 \leq j \leq 8$ and $g_{1}=16, g_{2}=60, g_{3}=120, g_{4}=96, g_{5}=180$, $\mathrm{g}_{7}=160$ and $\left.\left.\mathrm{g}_{8}=225 \in \mathrm{Z}_{240}\right\}, 1 \leq \mathrm{i} \leq 36\right\}$ be the open closed interval fuzzy semigroup of mixed dual numbers.

Interested reader can construct more examples; derive related properties as most of the results involved can be derived as a matter of routine.

## Chapter Six

## Applications Of Special Dual Like Numbers And Mxed Dual Numbers

Only in this book the notion of special dual like number is defined. In a dual number $\mathrm{a}+\mathrm{bg}_{1}$ we have $\mathrm{g}_{1}^{2}=0 ; \mathrm{a}$ and b reals and in special dual like number $a+b g$ we have $g^{2}=g$; $a$ and $b$ reals. Certainly special dual like numbers will find appropriate applications once this concept becomes popular among researchers. For we have the neutrosophic ring $\langle\mathrm{R} \cup \mathrm{I}\rangle$ or $\langle\mathrm{Q} \cup$ $\mathrm{I}\rangle$ or $\langle\mathrm{Z} \cup \mathrm{I}\rangle$ or $\left\langle\mathrm{Z}_{\mathrm{n}} \cup \mathrm{I}\right\rangle$ happens to be special ring. Thus where ever neutrosophic concepts are applied certainly the special dual like number concept can be used. We view I only as an idempotent of course not as an indeterminate.

Since to generate special dual like numbers distributive lattices are used certainly these concepts will find suitable applications. Further we also make use of the modulo integers in the construction of special dual like numbers. Keeping all these in mind, researchers would find several applications of this new number.

Finally the notion of mixed dual numbers exploits both the concept of special dual like numbers and dual numbers, so basically the least dimension of mixed dual numbers are three.

For if $\mathrm{x}=\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mathrm{~g}_{1}$ and $\mathrm{g}_{2}$ two new elements such that $g_{1}^{2}=0, g_{2}^{2}=g_{2}$ and $g_{1} g_{2}=g_{2} g_{1}=0$ or $g_{1}$ or $g_{2}$ and $a, b, c$ are reals then we define, x to be a mixed dual number.

It is pertinent to mention here we cannot use lattices to construct mixed dual numbers.

The only concrete structure from where we get mixed dual numbers are from $Z_{n}$, $n$ not a prime $n=4 m$. So we think this new numbers will also find applications only when this concept becomes popular and more research in this direction are taken up by researchers. Also this study forces more research on the modulo integers $\mathrm{Z}_{\mathrm{n}}$, n a composite number.

## Chapter Seven

## Suggested Problems

In this chapter we suggest 145 number of problems of which some are simple exercise and some of them are difficult or can be treated as research problems.

1. Discuss some properties of special dual number like rings.
2. Is $\mathrm{M}=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Q} ; \mathrm{g}=10 \in \mathrm{Z}_{15}\right\}$ be a semigroup under $\times$. Enumerate a few interesting properties associated with it.
3. Let $S= \begin{cases}{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4} \\ a_{5} & a_{6} \\ a_{7} & a_{8}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { with } x_{i}, y_{i} \in Q ; 1 \leq i \leq 8 \text {, }, ~}\end{cases}$
$\left.\mathrm{g}=\left(\begin{array}{llll}3 & 4 & 4 & 3 \\ 4 & 3 & 3 & 4\end{array}\right), 3,4 \in \mathrm{Z}_{6}\right\}$ be the ring of special dual
like numbers under natural product $\times_{n}$.
(i) Find subrings in S which are not ideals of S .
(ii) Find ideals of S.
(iii) Find zero divisors in $S$.
(iv) Show ideals of S form a modular lattice.
4. Show if $S=\left\{a+b g \mid a, b \in R, g^{2}=g=3 \in Z_{6}\right\}$ is the special dual like number ring then any $x \times y$ in $S$ need not in general be of the form $a+b g ; b, a \in R$.
(i) Can S have zero divisors?
(ii) Can $\mathrm{a}+\mathrm{bg}$ have inverse? $(\mathrm{a}, \mathrm{b} \in \mathrm{R} \backslash\{0\})$.
(iii) Can $\mathrm{x}=\mathrm{a}+\mathrm{bg} \in \mathrm{S}$ be an idempotent? (with $\mathrm{a}, \mathrm{b} \in$ $\mathrm{R} \backslash\{0\}$ ).
5. Enumerate the special properties enjoyed by $\mathrm{Z}_{\mathrm{n}}(\mathrm{g})$.
6. Let $S=\left\{a+b g \mid a, b \in Z_{7} g=11 \in Z_{22}\right\}$ be the special dual like number ring.
(i) Find subrings of S which are not ideals? (is it possible).
(ii) Find the cardinality of S.
(iii) Does S contain subring?
(iv) Can S have zero divisor or idempotents?
7. Is $(\mathrm{Q}(\mathrm{g}),+, \times)$ where $\mathrm{g}=9 \in \mathrm{Z}_{12}$ an integral domain?
8. Let $Z(g)=\left\{a+b g \mid a, b \in Z\right.$ and $\left.g=\left[\begin{array}{ll}1 & 1 \\ 1 & 0 \\ 0 & 1 \\ 1 & 1 \\ 0 & 0\end{array}\right]\right\}$ be a special dual like number ring.
(i) Can $Z(g)$ have idempotents?
(ii) $\operatorname{Can} Z(g)$ have ideals?
9. Let $S=Z_{p}(g)=\left\{a+b g \mid a, b \in Z_{p}, g^{2}=g\right\}$ be the special dual like number ring ( p a prime).
(i) Can S have subrings which are not ideals?
(ii) Can S have zero divisors?
(iii) Can $\mathrm{a}+\mathrm{bg}, \mathrm{a}, \mathrm{b} \in \mathrm{Z}_{\mathrm{p}} \backslash\{0\}$ have inverse?
(iv) Can S have idempotents of the form $\mathrm{a}+\mathrm{bg}, \mathrm{a}, \mathrm{b} \in$ $\mathrm{Z}_{\mathrm{p}} \backslash\{0\}$ ?
10. Find the orthogonal subrings of S given in problem 9.
11. Let $S=\left\{\left(x_{1}, x_{2}, x_{3}, x_{4}, x_{5}\right)+\left(y_{1}, y_{2}, y_{3}, y_{4}, y_{5}\right) g \mid x_{i}, y_{i} \in\right.$ $\left.\mathrm{Q}, 1 \leq \mathrm{i} \leq 5, \mathrm{~g}=4 \in \mathrm{Z}_{6}\right\}$ be the special dual like number ring.
(i) Prove S have zero divisors.
(ii) Can S have idempotents?
(iii) Find ideal of S.
12. Let $M= \begin{cases}{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4} \\ a_{5} & a_{6} \\ a_{7} & a_{8} \\ a_{9} & a_{10}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } x_{i}, y_{i} \in Q ; 1 \leq i}\end{cases}$
$\leq 10, \mathrm{~g}=(3,4,3,4,4,3,4)$ with $\left.3,4 \in \mathrm{Z}_{6}\right\}$ be a special dual like ring under the natural product $\times_{n}$.
(i) Do the zero divisors of M form an ideal?
(ii) Does M contain a subring which is not an ideal?
13. Let $M=\left\{\left.\left\{\begin{array}{llll}a_{1} & a_{2} & a_{3} & a_{4} \\ a_{5} & a_{6} & a_{7} & a_{8} \\ a_{9} & a_{10} & a_{11} & a_{12} \\ a_{13} & a_{14} & a_{15} & a_{16}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.$ where $x_{i}, y_{i}$
$\left.\in \mathrm{Z}_{31} ; 1 \leq \mathrm{i} \leq 16, \mathrm{~g}=\left[\begin{array}{lll}3 & 4 & 5 \\ 4 & 3 & 4\end{array}\right], 3,4 \in \mathrm{Z}_{6}\right\}$ be a special dual like ring under the natural product $x$.
(i) Show M is non commutative.
(ii) Find zero divisors of $M$.
(iii) What is the cardinality of M ?
(iv) Is M a S-ring?
14. In M in problem 13 is under natural product $\times_{\mathrm{n}}$ distinguish the special features of $M$ under $\times_{n}$ and under $\times$.
15. Let $P=\left\{\left.\left[\begin{array}{llll}a_{1} & a_{2} & \ldots & a_{10} \\ a_{11} & a_{12} & \ldots & a_{20} \\ a_{21} & a_{22} & \ldots & a_{30}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.$ where $x_{i}, y_{i} \in$
$\left.Z_{3} ; 1 \leq i \leq 30, g=\left[\begin{array}{ll}1 & 1 \\ 0 & 1\end{array}\right], g \times_{\mathrm{n}} \mathrm{g}=\mathrm{g}\right\}$ be the special dual
like number ring under the natural product $\times_{n}$.
(i) Find the number of elements in P .
(ii) Find subrings which are not ideals in P .
16. Describe some of the special features enjoyed by special dual like number vector spaces V over the field Q or R .
17. Let $V=\left\{a+b g \mid a, b \in R, g^{2}=g, g\right.$ the new element $\}$ be the special dual like number vector space over the field $R$.
(i) Find a basis of V over R.
(ii) Write V as a direct sum of subspaces.
(iii) Find $\mathrm{L}(\mathrm{V}, \mathrm{R})=\{$ all linear functional from V to R$\}$. What is the algebraic structure enjoyed by $\mathrm{L}(\mathrm{V}, \mathrm{R})$ ?
18. Let $W=\left\{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.$ where $x_{i}, y_{i} \in Q ; 1 \leq i \leq$ $\left.4, \mathrm{~g}=7 \in \mathrm{Z}_{14}\right\}$ be the special dual like number vector space over the field Q .
(i) Is W a linear algebra under usual matrix product?
(ii) Find a basis of W over Q as a vector space as well as a linear algebra.
(iii) Is the dimension of W the same as a vector space or as a linear algebra?
(iv) Write W as a pseudo direct sum of subspaces.
19. Let $P= \begin{cases}{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4} \\ a_{5} & a_{6} \\ a_{7} & a_{8}\end{array}\right]+\left[\begin{array}{ll}b_{1} & b_{2} \\ b_{3} & b_{4} \\ b_{5} & b_{6} \\ b_{7} & b_{8}\end{array}\right] g \right\rvert\, a_{i}, b_{j} \in Z_{7}, 1 \leq i, j \leq 8 ; ~}\end{cases}$
$\left.\mathrm{g}=13 \in \mathrm{Z}_{26}\right\}$ be a linear algebra of special dual numbers under the natural product $\times_{n}$ over $Z_{7}$.
(i) Find $\operatorname{Hom}(\mathrm{P}, \mathrm{P})$.
(ii) Find a basis of P over $\mathrm{Z}_{7}$.
(iii) Find the number of elements in $P$.
20. Let $\mathrm{M}=\left\{\left.\left\{\begin{array}{cccc}a_{1} & a_{2} & \ldots & a_{8} \\ a_{9} & a_{10} & \ldots & a_{16} \\ a_{17} & a_{18} & \ldots & a_{24} \\ a_{25} & a_{26} & \ldots & a_{32}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.$ with $x_{i}, y_{i} \in$
$\left.\mathrm{Z}_{11}, 1 \leq \mathrm{i} \leq 32 ; \mathrm{g}=\left[\begin{array}{l}4 \\ 3 \\ 4 \\ 3 \\ 4\end{array}\right] 4,3 \in \mathrm{Z}_{6}\right\}$ be a special dual like
number vector space over the field 11.
(i) Find dimension of $M$ over $Z_{11}$.
(ii) Find the number of elements in M .
(iii) If on $M$ we define the natural product $\times_{n}$, what is the dimension of $M$ as a linear algebra over $Z_{11}$ ?
(iv) Find $L\left(M, Z_{11}\right)$.
21. Let
$S=\left\{a+b g \mid a, b \in Z^{+} \cup\{0\}, g=(13,14), 13,14 \in Z_{26}\right\}$ be the semiring.
(i) Can S be a semifield?
(ii) Is S a strict semiring?
(iii) Can S have zero divisors?
22. Let $M=\left\{\begin{array}{l}{\left.\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3} \\ a_{4}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g \text { where } x_{i}, y_{i} \in Q^{+} \cup\{0\} ; 1 \leq, ~}\end{array}\right.$ $\left.\mathrm{i} \leq 4, \mathrm{~g}=(17,18,17,18), 17,18 \in \mathrm{Z}_{34}\right\}$ be the semiring.
(i) Does M contain subsemirings which are not ideals?
(ii) Can $T=\left\{\left.\left[\begin{array}{c}a_{1} \\ a_{2} \\ 0 \\ 0\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.$ with $x_{i}, y_{i} \in Q^{+} \cup\{0\}$;
$\left.1 \leq i \leq 2, g=(17,18,17,18), 17,18 \in Z_{34}\right\} \subseteq M$ be a semiideal of M?
(iii) Suppose $W=\left\{\left.\left[\begin{array}{l}0 \\ 0 \\ a_{1} \\ a_{2}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.$ with $x_{i}, y_{i} \in$ $\mathrm{Q}^{+} \cup\{0\} ; 1 \leq \mathrm{i} \leq 2, \mathrm{~g}=(17,18,17,18), 17,18 \in$ $\left.\mathrm{Z}_{34}\right\} \subseteq \mathrm{M}$; can W be a semiideal such that T and W are orthogonal?
23. Give an example of a general semifield of special dual like numbers.
24. Let $\mathrm{P}=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}^{+}, \mathrm{g}=\left(\begin{array}{cccc}5 & 6 & 5 & 6 \\ 6 & 5 & 6 & 5\end{array}\right) ; 5,6 \in\right.$ $\left.\mathrm{Z}_{10}\right\} \cup\{0\}$ be the semified of special dual like numbers.
(i) Can P have subsemifields?
(ii) Can P have subsemirings?
25. Let $M=\left\{\left.\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.$ where $x_{i}, y_{i} \in Q^{+} ; g=\left[\begin{array}{l}13 \\ 14 \\ 13\end{array}\right]$;
$\left.13,16 \in \mathrm{Z}_{26} 1 \leq \mathrm{i} \leq 3\right\} \cup\left\{\left[\begin{array}{l}0 \\ 0 \\ 0\end{array}\right]\right\}$ be the semiring of special dual like numbers under natural product $\times_{n}$.
(i) Can M be a semifield?
(ii) Can M have semiideals?
(iii) Can $M$ have subsemirings?
26. Give an example of a general semiring of special dual like numbers which is not a semifield.
27. Let $\mathrm{M}=\left\{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.$ with $x_{i}, y_{i} \in R^{+} ; 1 \leq i \leq$ $\left.4, \mathrm{~g}=(5,6), 5,6 \in \mathrm{Z}_{10}\right\} \cup\left\{\left[\begin{array}{ll}0 & 0 \\ 0 & 0\end{array}\right]\right\}$ be the general semiring of special dual lime numbers under the usual product $\times$.
(i) Can M be a semifield?
(ii) Is M a S-semiring?
(iii) Can M have right semiideals which are not left semiideals?
28. Suppose $M$ in problem (27) is under natural product $\times_{n}$ what can we say about M?
29. Let $\mathrm{P}=\left\{\mathrm{x}+\mathrm{yg} \mid \mathrm{x}, \mathrm{y} \in \mathrm{Q}^{+}, \mathrm{g}=\left(\begin{array}{lllll}10 & 0 & 11\end{array}\right)\right\} \cup\{0\}$ be the semifield of special dual like numbers. Study the special features enjoyed by P .
30. Let $P=\left\{\left.\left[\begin{array}{lllll}a_{1} & a_{2} & a_{3} & \ldots & a_{12} \\ a_{13} & a_{14} & a_{15} & \ldots & a_{24} \\ a_{25} & a_{26} & a_{27} & \ldots & a_{36}\end{array}\right] \right\rvert\,\right.$ with $a_{i}=x_{i}+y_{i} g$
where $\left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} ; 1 \leq \mathrm{i} \leq 36, \mathrm{~g}=3 \in \mathrm{Z}_{6}\right\} \cup$
$\left\{\left[\begin{array}{ccccc}0 & 0 & 0 & \ldots & 0 \\ 0 & 0 & 0 & \ldots & 0 \\ 0 & 0 & 0 & \ldots & 0\end{array}\right]\right\}$ be a semiring of special dual like numbers.
(i) Can $\mathrm{Z}^{+} \subseteq$ S? Justify.
(ii) $\mathrm{Can}^{+} \mathrm{g} \subseteq \mathrm{S}$ ? Justify.
(iii) Can S have subsemifield?
31. Find all the idempotents of $\mathrm{Z}_{46}$.
32. Find all the idmepotents of $\mathrm{Z}_{12}$.
(i) Are the idempotents in $\mathrm{Z}_{12}$ orthogonal?
(ii) Do the set of idempotents of $\mathrm{Z}_{12}$ form a semigroup under product?
33. Find all the idempotents of $Z_{30}$.
(i) How many idempotents does $\mathrm{Z}_{30}$ contain?
(ii) Do the set with 0 form a semigroup under product?
34. Find the number of idempotents in $\mathrm{Z}_{105}$.
35. Let $\mathrm{Z}_{\mathrm{n}}$ be such that $\mathrm{n}=\mathrm{p}_{1} \mathrm{p}_{2} \ldots \mathrm{p}_{\mathrm{t}} ; \mathrm{t}<\mathrm{n}$ and each $\mathrm{p}_{\mathrm{i}}$ is a prime and $p_{i} \neq p_{j}$ if $i \neq j$.
(i) Find all the idempotents in $Z_{n}$.
(ii) What is the order of the semigroup of idempotents of $\mathrm{Z}_{\mathrm{n}}$ with zero?
(iii) Are the idempotents of $\mathrm{Z}_{\mathrm{n}}$ orthogonal?
36. Let $\mathrm{Z}_{4900}$ be the ring of modulo integers. Find the number of idempotents in $\mathrm{Z}_{4900}$.
(i) Hence or otherwise find the number of idempotents in $Z_{p_{1}^{2}, p_{2}^{2}, p_{3}^{2}}$ each $p_{i}$ is a distinct prime; $i=1,2,3$.
(ii) Further if $Z_{p_{1}^{n_{1}}, p_{2}^{n_{2}}, \ldots, p_{1}^{n_{1}}}$ be the ring of integers $p_{i} \neq p_{j}$ if $\mathrm{i} \neq \mathrm{j}$ are distinct primes; $\mathrm{n}_{\mathrm{i}} \geq 2 ; 1 \leq \mathrm{i} \leq \mathrm{t}$. Find the number of idempotents in $Z_{p_{1}^{n_{1}^{1}}, p_{2}^{n_{2}}, \ldots, p_{1}^{n_{1}}}$.
37. Prove $Z_{p}$, $p$ a prime cannot have idempotents, other than 0 and 1.
38. Prove using 5, 6, 0 of $\mathrm{Z}_{10}$ we can build infinitely many idempotents which can be used to construct special dual like numbers.
39. Study the special dual like number semivector space / semilinear algebra.
40. Let $\mathrm{V}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{5}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{g}\right.$ where $\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} ; 1$ $\left.\leq \mathrm{i} \leq 5, \mathrm{~g}=7 \in \mathrm{Z}_{14}\right\} \cup\{(0,0, \ldots, 0)\}$ be a semivector space over the semifield $\mathrm{F}=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}^{+}\right\} \cup\{0\}$. ( $\mathrm{g}=7 \in \mathrm{Z}_{14}$ ).
(i) Find a basis for V.
(ii) Is V finite dimensional over F ?
(iii) If F is replaced by $\mathrm{Z}^{+} \cup\{0\}$; will V be finite dimensional?
(iv) Is V a semilinear algebra over F ?
(v) What is dimension of V as a semilinear algebra?
(vi) Write V as a direct sum of semivector spaces.
41. $\quad$ Can $\mathrm{Z}_{\mathrm{p}^{2}}$ have idempotents, p a prime?
42. Let $S=\left\{\begin{array}{ll}{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4} \\ a_{5} & a_{6} \\ a_{7} & a_{8}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g ; g=10 \in Z_{30}, x_{i}, y_{i} \in} \\ \end{array}\right]$
$\left.\mathrm{Z}^{+} ; 1 \leq \mathrm{i} \leq 8\right\} \cup\left\{\left[\begin{array}{ll}0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0\end{array}\right]\right\}$ be the semivector space of
special dual like numbers over the semifield $\mathrm{F}=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Z}^{+}, \mathrm{g}=10 \in \mathrm{Z}_{10}\right\} \cup\{0\}$.
(i) Find a basis of S over F .
(ii) Can S be made into a semilinear algebra?
(iii) Study the special features enjoyed by $S$.
43. Find the algebraic structure enjoyed by $\operatorname{Hom}_{F}(S, S), S$ given in problem 42.
44. Find the properties enjoyed by $L(S, F)=\{$ all linear functional from $S$ to $F\}, S$ given in problem (42).
45. Let $\mathrm{M}=\left\{\left.\left[\begin{array}{lllll}a_{1} & a_{2} & a_{3} & \ldots & a_{10} \\ a_{11} & a_{12} & a_{13} & \ldots & a_{20}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g ; g=17\right.$
$\left.\in Z_{34}, x_{i}, y_{i} \in Q^{+} ; 1 \leq i \leq 20\right\} \cup\left\{\left[\begin{array}{ccccc}0 & 0 & 0 & \ldots & 0 \\ 0 & 0 & 0 & \ldots & 0\end{array}\right]\right\}$ be
the semivector space over the semifield $S=\{a+b g \mid a, b$ $\left.\in \mathrm{Q}^{+}\right\} \cup\{0\}$ of special dual like numbes.
$P=\left\{\left.\left[\begin{array}{ccc}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ \vdots & \vdots & \vdots \\ a_{19} & a_{20} & a_{21}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g ; g=17 \in Z_{38}, x_{i}, y_{i} \in\right.$
$\left.\mathrm{Q}^{+} ; 1 \leq \mathrm{i} \leq 21\right\} \cup\left\{\left[\begin{array}{ccc}0 & 0 & 0 \\ 0 & 0 & 0 \\ \vdots & \vdots & \vdots \\ 0 & 0 & 0\end{array}\right]\right\}$ be the semivector space
over the semifield $\mathrm{S}=\left\{\mathrm{a}+\mathrm{bg} \mid \mathrm{a}, \mathrm{b} \in \mathrm{Q}^{+}\right\} \cup\{0\}$.
(i) Find $\operatorname{Hom}(\mathrm{M}, \mathrm{P})$.
(ii) Study the algebraic structure enjoyed by $\operatorname{Hom}(\mathrm{M}$, P).
(iii) Study the properties of $\operatorname{Hom}(\mathrm{M}, \mathrm{M})$ and $\operatorname{Hom}(\mathrm{P}, \mathrm{P})$ and compare them.
(iv) Study $\mathrm{L}(\mathrm{M}, \mathrm{S})$ and $\mathrm{L}(\mathrm{P}, \mathrm{S})$ and compare them.
(v) What will be the change if S is replaced by $\mathrm{Z}^{+} \cup$ $\{0\}$ ?
(vi) Study (i), (ii) and (iii) when $S$ is replaced by $Z^{+} \cup$ $\{0\}$.
46. Let
$\mathrm{S}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{g} ; \mathrm{g}=4 \in \mathrm{Z}_{6}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\}\right\}$
be the semivector space of special dual like numbers over the semifield

$$
F=\left\{a+b g \mid a, b \in Z^{+} ; 4=g \in Z_{6}\right\} \cup\{0\} .
$$

(i) Find dimension of S over F.
(ii) Find a basis of S over F.
(iii) Find $\operatorname{Hom}_{\mathrm{F}}(\mathrm{S}, \mathrm{S})$
(iv) Find L(S, F).
47. Determine some interesting features enjoyed by special set vector spaces of special dual like numbers.
48. Let $\mathrm{M}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}\right),\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3}\end{array}\right], \left.\left(\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4}\end{array}\right) \right\rvert\, a_{i}=x_{i}+y ; g ; g=(4\right.$,
$\left.3,4,3), 4,3 \in Z_{6}, x_{i}, y_{i} \in Q ; 1 \leq i \leq 4\right\}$ be the special set vector space of special dual like numbers over the set $3 Z$ $\cup 5 \mathrm{Z}$.
(i) Find $\operatorname{Hom}(V, V)$.
(ii) Find $L(V, 3 Z \cup 5 Z)$.
49. Let $\mathrm{T}=\left\{\mathrm{a}+\mathrm{bg}_{1}, \mathrm{c}+\mathrm{dg}_{2}, \mathrm{e}+\mathrm{fg}_{3} \mid \mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}, \mathrm{e}, \mathrm{f} \in \mathrm{Q} ; \mathrm{g}_{1}=\right.$ $(7,8,7,8), \mathrm{g}_{2}=\left[\begin{array}{l}5 \\ 6 \\ 5 \\ 6\end{array}\right]$ and $\mathrm{g}_{3}=\left[\begin{array}{cc}13 & 14 \\ 0 & 13\end{array}\right], 7,8 \in \mathrm{Z}_{14}, 5,6 \in$
$Z_{10}$ and $\left.13,14 \in Z_{26}\right\}$ be a special set vector space of special dual like numbers over the set $S=3 \mathrm{Z} \cup 7 \mathrm{Z} \cup 11 \mathrm{Z}$.
(i) Find set special vector subspaces of T over S .
(ii) Write T as a direct sum of set special vector subspaces over S .
(iii) Find $\operatorname{Hom}_{\mathrm{S}}(\mathrm{T}, \mathrm{T})$.
(iv) Find $\mathrm{L}(\mathrm{T}, \mathrm{S})$.
50. Let $\mathrm{W}=\left\{\mathrm{a}+\mathrm{bg}_{1}, \left.\left(\begin{array}{ll}\mathrm{a}_{1} & \mathrm{a}_{2} \\ \mathrm{a}_{3} & \mathrm{a}_{4}\end{array}\right) \right\rvert\, \mathrm{a}, \mathrm{b} \in \mathrm{Z}^{+} \cup\{0\}\right.$,

$$
\mathrm{g}_{1}=\left[\begin{array}{ll}
11 & 11 \\
12 & 12
\end{array}\right], 11,12 \in \mathrm{Z}_{22}, \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{\mathrm{i}}+\mathrm{y}_{\mathrm{i}} \mathrm{~g}_{2} \text { with } \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in
$$

$\left.\mathrm{Q}^{+} \cup\{0\} 1 \leq \mathrm{i} \leq 4, \mathrm{~g}_{2}=\left[\begin{array}{llll}7 & 8 & 7 & 8 \\ 8 & 7 & 8 & 7\end{array}\right], 7,8 \in \mathrm{Z}_{14}\right\}$ be a
special set semivector space over the set $S=3 Z^{+} \cup 5 Z^{+} \cup$ $\{0\}$ of special dual like numbers.
(i) Find $\operatorname{Hom}_{\mathrm{S}}(\mathrm{W}, \mathrm{W})$.
(ii) Find L(W, S).
(iii) Can W have a basis?
(iv) Write W as a pseudo direct sum of special set semivector subspaces of W over S .
51. Let $V=\left\{\left(a_{1}, a_{2}, a_{3}, a_{4}\right),\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3}\end{array}\right], \left.\left[\begin{array}{ccc}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9}\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.$

$$
\left.\left.\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{+} \cup\{0\}, \mathrm{g}=4 \in \mathrm{Z}_{6}\right\} 1 \leq \mathrm{i} \leq 9\right\} \text { and }
$$

$$
M=\left\{\left[\begin{array}{llll}
a_{1} & a_{2} & \ldots & a_{5} \\
a_{6} & a_{7} & \ldots & a_{10}
\end{array}\right],\left[\begin{array}{c}
a_{1} \\
a_{2} \\
\vdots \\
a_{8}
\end{array}\right], \left.\left[\begin{array}{cc}
a_{1} & a_{2} \\
0 & a_{3}
\end{array}\right] \right\rvert\, a_{i}=x_{i}+y_{i} g\right.
$$

$\left.\mathrm{g}=4 \in \mathrm{Z}_{6}, \mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 10\right\}$ be special set semivector spaces of special dual like numbers over the set $S=3 Z^{+} \cup 5 Z^{+} \cup\{0\}$.
(i) Find $\operatorname{Hom}_{s}(V, M)$.
(ii) Study Hom (V, V) and Hom (M, M) and compare them.
(iii) Study $L(V, S)$ and $L(M, S)$ and compare them.
52. Prove $\mathrm{M}=\{\mathrm{A}+\mathrm{Bg} \mid \mathrm{A}$ and B are $\mathrm{m} \times \mathrm{n}$ matrices with
entries from $Q$ and $\left.g=\left[\begin{array}{cccc}4 & 0 & 4 & 3 \\ 3 & 4 & 0 & 4 \\ 4 & 3 & 0 & 3 \\ 3 & 0 & 3 & 0\end{array}\right], 3,4 \in \mathrm{Z}_{6}\right\}$ and S
$=\left\{\left(\mathrm{a}_{\mathrm{ij}}\right)_{\mathrm{m} \times \mathrm{n}}\right.$ where $\mathrm{a}_{\mathrm{ij}}=\mathrm{c}_{\mathrm{ij}}+\mathrm{d}_{\mathrm{ij}} \mathrm{g}$ where $\mathrm{c}_{\mathrm{ij}}, \mathrm{d}_{\mathrm{ij}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq \mathrm{m}$
and $\left.\mathrm{l} \leq \mathrm{j} \leq \mathrm{n}, \mathrm{g}=\left[\begin{array}{cccc}4 & 0 & 4 & 3 \\ 3 & 4 & 0 & 4 \\ 4 & 3 & 0 & 3 \\ 3 & 0 & 3 & 0\end{array}\right] 3,4 \in \mathrm{Z}_{6}\right\}$ as general
ring of special dual like numbers are isomorphic.
(i) If M and S are taken as vector spaces of special dual like numbers over the field Q are they isomorphic?
53. Is it possible to get any n-dimensional special dual like numbers; n arbitrarty positive integer?
54. Find some special properties by n-dimensional special dual like numbers.
55. What is the significance of using lattices in the construction of special dual like numbers?
56. Give some applications of n-dimensional special dual like numbers?
57. What is the advantage of using $n$-dimensional special dual like numbers instead of dual numbers?
58. Prove $\mathrm{C}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)=\left\{\mathrm{a}+\mathrm{bg}_{1}+\mathrm{cg}_{2} \mid \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{C}\right.$ (complex numbers)

is a general ring of special dual like numbers of dimension three.
59. Study some special features enjoyed by $C\left(g_{1}, g_{2}, \ldots, g_{t}\right)=$ $\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{\mathrm{t}+1} \mathrm{~g}_{\mathrm{t}} \mid \mathrm{x}_{\mathrm{j}} \in \mathrm{L} ; 1 \leq \mathrm{j} \leq \mathrm{t}+1 . \mathrm{g}_{\mathrm{k}} \in \mathrm{L}=\right.$

60. Study the $5 \times 3$ matrices with entries from $C\left(g_{1}, g_{2}, g_{3}, g_{4}\right)$ where $g_{i} \in L=$

61. Obtain some interesting properties about lattice ring RL where $L$ is a distributive lattice of finite order $n$ and $R$ a
commutative ring with unit. Show RL is a ( $\mathrm{n}-1$ ) special dual like number ring.
62. Let $\mathrm{ZL}=\left\{\begin{array}{l}a+\sum_{\mathrm{i}} \mathrm{a}_{\mathrm{i}} \mathrm{m}_{\mathrm{i}} \mid \mathrm{a}, \mathrm{a}_{\mathrm{i}} \in \mathrm{Z}, \mathrm{m}_{\mathrm{i}} \in \mathrm{L}=\left\{\begin{array}{l}1 \\ \mathrm{~m}_{1} \\ \mathrm{~m}_{2} \\ m_{3} \\ \vdots \\ \mathrm{~m}_{8} \\ 0\end{array}\right.\end{array}\right.$
$1 \leq i \leq 8\}$ be the lattice ring.
(i) What is dimension of ZL as a special dual like number ring?
(ii) Can ZL have ideals of lesser dimension?
(iii) Can ZL have 4-dimension special dual like ring?
(iv) Can ZL have zero divisor?
(v) Is ZL an integral domain?
63. Let $\mathrm{Z}_{84}$ be the ring of integers. Find all idempotents of $\mathrm{Z}_{84}$. Is that collection a semigroup under multiplication modulo 84?
64. Give an example of a 8-dimensional general ring of special dual like numbers.
65. Give an example of a 5-dimensional general semiring of special dual like numbers.
66. Give an example of a finite 5- dimensional general ring of special dual like numbers.
67. Is $Z_{8}\left(g_{1}, g_{2}, g_{3}, g_{4}\right)=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}+a_{5} g_{4} \mid a_{i} \in\right.$ $\mathrm{Z}_{8}, 1 \leq \mathrm{i} \leq 5, \mathrm{~g}_{\mathrm{j}} \in \mathrm{L}$,

$1 \leq \mathrm{j} \leq 4\}$ a general 5-dimensional special dual like number ring?
68. Let $S=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}+a_{5} g_{4}+a_{6} g_{5}+a_{7} g_{6} \mid a_{i} \in\right.$ $\mathrm{Z}_{25}, 1 \leq \mathrm{i} \leq 7$, and

$1 \leq \mathrm{j} \leq 6\}$ be the general seven dimensional special dual like number ring.
(i) Find the number of elements in S .
(ii) Can S have ideals which are 3-dimensional?
(iii) Can S have 2- dimensional subring?
(iv) Can S have zero divisors?
(v) Can S have units?
69. Let $P=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}+a_{5} g_{4} \mid a_{i} \in Z_{7}, 1 \leq i \leq 5\right.$, $\mathrm{g}_{1}=(1,0,0,0), \mathrm{g}_{2}=(0,1,0,0) \mathrm{g}_{3}=(0,0,1,0)$ and $\left.\mathrm{g}_{4}=(0,0,0,1)\right\}$ be the special dual like number general ring.
(i) Prove P is a S-ring.
(ii) Can P have zero divisors?
(iii) Give examples of subrings which are not ideals.
70. Let $\mathrm{M}=\left\{\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}+\mathrm{a}_{3} \mathrm{~g}_{2}+\mathrm{a}_{4} \mathrm{~g}_{3}+\mathrm{a}_{5} \mathrm{~g}_{4}+\mathrm{a}_{6} \mathrm{~g}_{5} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Z}_{3}\right.$;
$1 \leq \mathrm{i} \leq 3 ; \mathrm{g}_{1}=\left[\begin{array}{ll}3 & 0 \\ 0 & 4 \\ 0 & 0\end{array}\right], \mathrm{g}_{2}=\left[\begin{array}{ll}4 & 0 \\ 0 & 3 \\ 0 & 0\end{array}\right] \mathrm{g}_{3}=\left[\begin{array}{ll}0 & 4 \\ 3 & 0 \\ 0 & 0\end{array}\right]$
$g_{4}=\left[\begin{array}{ll}0 & 3 \\ 4 & 0 \\ 0 & 0\end{array}\right], g_{5}=\left[\begin{array}{ll}0 & 0 \\ 0 & 0 \\ 4 & 3\end{array}\right]$ where $\left.4,3 \in Z_{6}\right\}$ be the special dual like number ring.
(i) Find the number of elements in M
(ii) Can M have zero divisors?
(iii) Can $\mathrm{a}_{1}+\mathrm{a}_{2} \mathrm{~g}_{1}\left(\mathrm{a}_{1}, \mathrm{a}_{2} \in \mathrm{Z}_{3} \backslash\{0\}\right)$ be an idempotent in M?
(iv) Can $x$ in $M$ have $x^{-1}$ such that $x^{-1}=1\left(x \notin Z_{3}\right)$ ?
71. Let $S=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}+a_{5} g_{4}+a_{6} g_{5}+a_{7} g_{6} \mid a_{i} \in\right.$

$$
\mathrm{Z}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 6, \mathrm{~g}_{1}=\left[\begin{array}{l}
2 \\
0 \\
0 \\
0
\end{array}\right], \mathrm{g}_{2}=\left[\begin{array}{l}
2 \\
2 \\
0 \\
0
\end{array}\right], \mathrm{g}_{3}=\left[\begin{array}{l}
0 \\
0 \\
2 \\
0
\end{array}\right]
$$

$\left.\mathrm{g}_{4}=\left[\begin{array}{l}0 \\ 2 \\ 2 \\ 2\end{array}\right], \mathrm{g}_{5}=\left[\begin{array}{l}0 \\ 0 \\ 0 \\ 2\end{array}\right] ; 2 \in \mathrm{Z}_{4}\right\}$ be a general semiring of special dual like numbers.
(i) Is S a S -semiring?
(ii) Can S have zero divisors?
(iii) Is S a semifield?
72. Let $S=\left\{a_{1}+a_{2} g_{1}+a_{3} g_{2}+a_{4} g_{3}+a_{5} g_{4}+a_{6} g_{5}+a_{7} g_{6}+a_{8} g_{7}\right.$ $\mid a_{i} \in Z^{+}, 1 \leq i \leq 8 ;$
$\mathrm{g}_{1}=\left[\begin{array}{ll}1 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0\end{array}\right], \mathrm{g}_{2}=\left[\begin{array}{ll}0 & 1 \\ 0 & 0 \\ 1 & 1 \\ 0 & 0 \\ 0 & 0\end{array}\right], \mathrm{g}_{3}=\left[\begin{array}{ll}0 & 0 \\ 1 & 0 \\ 0 & 0 \\ 1 & 0 \\ 0 & 0\end{array}\right] \mathrm{g}_{4}=\left[\begin{array}{ll}0 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0\end{array}\right]$,
$\mathrm{g}_{5}=\left[\begin{array}{ll}0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 1 & 0\end{array}\right], \mathrm{g}_{6}=\left[\begin{array}{ll}0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 1\end{array}\right]$ and $\mathrm{g}_{7}=\left[\begin{array}{ll}0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 1 \\ 0 & 0\end{array}\right]$
under natural product $\times_{n}, g_{i}{ }^{\prime}$ s are idempotents and $g_{j} \times_{n} g_{k}$
$=\left[\begin{array}{ll}0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0\end{array}\right]$ if $\left.\mathrm{j} \neq \mathrm{k}\right\} \cup\{0\}$ be a general semiring of special
dual like numbers.
(i) Is S a semifield?
(ii) Can S have semiideals?
(iii) Can S have subsemifields?
(iv) Is S a S -semiring?
73. Let $\mathrm{P}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}}=(0,0, \ldots, 1,0, \ldots, 0), \mathrm{a}_{1}=(1,0, \ldots\right.$ $0)$ and $\mathrm{a}_{2}=(0,1,0,0, \ldots 0)$ of 9 tuples $\}$ be the polynomials with idempotent coefficient
(i) Prove $(\mathrm{P},+)$ is not a semigroup.
(ii) Is $(\mathrm{P}, \times)$ a semigroup?
(iii) Can the semigroup ( $\mathrm{P}, \mathrm{x}$ ) have ideals?
(iv) Can P have zero divisors?
74. Let $S=\left\{\left.\left(\begin{array}{ll}g_{1} & g_{2} \\ g_{3} & g_{4} \\ g_{5} & g_{6} \\ g_{7} & g_{8}\end{array}\right) \right\rvert\, g_{i} \in\{0,3,4\} \subseteq Z_{6}, 1 \leq i \leq 8\right\}$ be a
semigroup under natural product $\times_{n}$.
(i) Prove S is finite?
(ii) Find ideals in S .
(iii) Find zero divisors in S .
(iv) Can S have subsemigroups which are not ideals?
75. Let $\mathrm{S}=$

$$
\begin{aligned}
& \left\{\left[\begin{array}{llll}
x_{1} & x_{2} & x_{3} & x_{4} \\
x_{5} & x_{6} & x_{7} & x_{8}
\end{array}\right]+\left[\begin{array}{llll}
\mathrm{y}_{1} & \mathrm{y}_{2} & \mathrm{y}_{3} & \mathrm{y}_{4} \\
\mathrm{y}_{5} & \mathrm{y}_{6} & \mathrm{y}_{7} & \mathrm{y}_{8}
\end{array}\right] \mathrm{g}_{1}+\left[\begin{array}{llll}
\mathrm{z}_{1} & \mathrm{z}_{2} & \mathrm{z}_{3} & \mathrm{z}_{4} \\
\mathrm{z}_{5} & \mathrm{z}_{6} & \mathrm{z}_{7} & z_{8}
\end{array}\right] \mathrm{g}_{2}\right. \\
& {\left[\begin{array}{llll}
c_{1} & c_{2} & c_{3} & c_{4} \\
c_{5} & c_{6} & c_{7} & c_{8}
\end{array}\right] \mathrm{g}_{3}+\left[\begin{array}{llll}
\mathrm{a}_{1} & \mathrm{a}_{2} & a_{3} & a_{4} \\
\mathrm{a}_{5} & \mathrm{a}_{6} & \mathrm{a}_{7} & a_{8}
\end{array}\right] \mathrm{g}_{4}+\left[\begin{array}{llll}
\mathrm{d}_{1} & d_{2} & d_{3} & d_{4} \\
d_{5} & d_{6} & d_{7} & d_{8}
\end{array}\right] \mathrm{g}_{5}}
\end{aligned}
$$

$\mathrm{a}_{\mathrm{i}}, \mathrm{x}_{\mathrm{j}}, \mathrm{y}_{\mathrm{k}}, \mathrm{z}_{\mathrm{p}}, \mathrm{c}_{\mathrm{t}}, \mathrm{d}_{\mathrm{s}} \in \mathrm{Q}^{+}, 1 \leq \mathrm{i}, \mathrm{j}, \mathrm{k}, \mathrm{p}, \mathrm{t}, \mathrm{s}, \leq 8, \mathrm{~g}_{\mathrm{j}} \in \mathrm{L}$ where L is

$1 \leq \mathrm{i} \leq 5\} \cup\left\{\left[\begin{array}{llll}0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0\end{array}\right]\right\}$ be the semiring of special
dual like numbers.
(i) Is S a semifield?
(ii) Can S have subsemifields?
(iii) Can S have zero divisors?
76. Let $\mathrm{M}=\left\{\left.\left\{\begin{array}{llll}\mathrm{A}_{1} & \mathrm{~A}_{2} & \mathrm{~A}_{3} & \mathrm{~A}_{4} \\ \mathrm{~A}_{5} & \mathrm{~A}_{6} & \mathrm{~A}_{7} & \mathrm{~A}_{8}\end{array}\right] \right\rvert\,\right.$
$A_{i}=x_{1}^{i}+x_{2}^{i} g_{1}+\ldots+x_{6}^{i} g_{5} ; 1 \leq i \leq 8, x_{j}^{1} \in Q^{+}, 1 \leq j \leq 6$ and $\mathrm{g}_{\mathrm{k}} \in \mathrm{L}=$

$1 \leq \mathrm{k} \leq 5\} \cup\left\{\left[\begin{array}{llll}0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0\end{array}\right]\right\}$ be the general semiring
of special dual like numbers.
(i) Is M a semifield?
(ii) Can M have zero divisors?
(iii) Is M a strict semiring?
(iv) Can M be isomorphic to S given in problem (75)
77. Show if idempotents are taken form distributive lattice of order 9 and if
$\mathrm{S}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{9} \mathrm{~g}_{7} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Q} ; 1 \leq \mathrm{i} \leq 8, \mathrm{~g}_{\mathrm{j}} \in \mathrm{L}, 1 \leq \mathrm{j}\right.$ $\leq 7\}$ be the general ring of special dual like numbers then
$\mathrm{x} \times \mathrm{y}$ under the operation $\cap$ of $\mathrm{g}_{\mathrm{i}}$ and $\mathrm{g}_{\mathrm{j}}$ is different from x $\times y$ under the operation ' $\cup$ ' of $g_{i}$ and $g_{j}$.
78. Verify problem 77 if Q is replaced by $\mathrm{Q}^{+} \cup\{0\}$.
79. Obtain some interesting properties enjoyed by vector space of special dual like numbers over a field F .
80. Let $V=\left\{\left.\left[\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+\right.$ $\mathrm{x}_{5} \mathrm{~g}_{4} ; 1 \leq \mathrm{i} \leq 9 ; \mathrm{x}_{\mathrm{j}} \in \mathrm{Z}_{11}, 1 \leq \mathrm{j} \leq 5$ and

be a special vector space of dual like numbers over the field $\mathrm{Z}_{11}$.
(i) Find the number of elements in V .
(ii) What is the basis of V over $\mathrm{Z}_{11}$ ?
(iii) Write V as a direct sum of subspaces.
(iv) What is the algebraic structure enjoyed by $\operatorname{Hom}_{\mathrm{z}_{11}}(\mathrm{~V}, \mathrm{~V})$ ?
(v) If $T: V \rightarrow V$ is such that $T\left(\left[\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9}\end{array}\right]\right)=$ $\left[\begin{array}{ccc}0 & a_{2} & 0 \\ a_{1} & 0 & a_{3} \\ 0 & a_{4} & 0\end{array}\right]$; find the eigen values of $T$ and eigen vectors of T .

$\mathrm{x}_{\mathrm{j}} \in \mathrm{Q}, \mathrm{g}_{1}=(3,0,4), \mathrm{g}_{2}=(0,3,0)$ and $\mathrm{g}_{3}=(0,4,0) ; 3,4$ $\left.\in Z_{6}, 1 \leq j \leq 4\right\}$ be a special vector of special dual like numbers over the field Q .
(i) Find a basis of V over Q.
(ii) Write $V$ as a pseudo direct sum.
 $1 \leq \mathrm{i} \leq 2, \mathrm{~g}_{1}=\left(\begin{array}{lll}3 & 0\end{array}\right), \mathrm{g}_{2}\left(\begin{array}{ll}0 & 3\end{array}\right), \mathrm{g}_{3}=(0,4,0), 3,4$

$$
\left.\in \mathrm{Z}_{6}, 1 \leq \mathrm{j} \leq 4\right\} \subseteq \mathrm{V}, \mathrm{~W}_{2}=\left\{\left(\begin{array}{c}

\mathrm{a}_{2}
\end{array}\right] \right\rvert\, \mathrm{a}_{1}, \mathrm{a}_{2} \in \mathrm{Q}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right)\right\} \subseteq \mathrm{V} \text { are }
\end{array}\right. \\
& \hline
\end{aligned}
$$

subspaces of V. Find projections $E_{1}, E_{2}, E_{3}$ and $E_{4}$ of V on $\mathrm{W}_{1}, \mathrm{~W}_{2}, \mathrm{~W}_{3}$ and $\mathrm{W}_{4}$ respectively and show projection contribute to special dual like numbers. Verify spectral theorem $E_{1}, E_{2}, E_{3}$ and $E_{4}$ by suitable and appropriate operations on V .
82. Let $V=\left\{\left(a_{1}, a_{2}, a_{3}, a_{4}\right) \mid a_{i} \in Q\left(g_{1}, g_{2}\right) ; 1 \leq i \leq 4\right.$,

be a Smarandache special vector space of special dual like numbers over the S-ring $\mathrm{Q}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$.
(i) Find a basis of $S$ over $Q\left(g_{1}, g_{2}\right)$.
(ii) Write S as a direct sum of subspaces.
(iii) Find $\operatorname{Hom}(\mathrm{S}, \mathrm{S})$.
(iv) Find L(S, Q $\left.\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)\right)$.
(v) Show eigen values can also be special dual like numbers.
83. Let $\mathrm{M}=\left\{\left.\left\{\begin{array}{llll}\mathrm{a}_{1} & a_{2} & \ldots & a_{6} \\ \mathrm{a}_{7} & \mathrm{a}_{8} & \ldots & a_{12}\end{array}\right] \right\rvert\, \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}\right.$
$+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}, 1 \leq \mathrm{i} \leq 12 \mathrm{a}_{\mathrm{i}} \in \mathrm{Z}_{12}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{6}\right)$ where

be a Smarandache vector space of special dual like numbers over the S -ring; $\mathrm{Z}_{12}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{6}\right)$,
(i) Find the number of elements in M.
(ii) Find a basis of M over $\mathrm{Z}_{12}\left(\mathrm{~g}_{1}, \ldots, \mathrm{~g}_{6}\right)$.
(iii) Write M as a direct sum.
(iv) Find $\operatorname{Hom}(\mathrm{M}, \mathrm{M})$.
(v) Find L (M, $\mathrm{Z}_{12},\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{6}\right)$ ).
83. Let $\mathrm{V}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{7}\right) \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Q}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right) \cup\{0\}, 1 \leq \mathrm{i} \leq 7\right\}$,

be the special dual like number semivector space over the semifield $\mathrm{Q}^{+} \cup\{0\}$.
(i) Find a basis of V over $\mathrm{Q}^{+} \cup\{0\}$.
(ii) Study the algebraic structure enjoyed by $\operatorname{Hom}(V, V)$.
(iii) Study the set $\mathrm{L}\left(\mathrm{V}, \mathrm{Q}^{+} \cup\{0\}\right)$ if $\mathrm{f}: \mathrm{V} \rightarrow \mathrm{Q}^{+} \cup\{0\}$ is given by $\mathrm{f}\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots \mathrm{a}_{7}\right)=\left(\mathrm{x}_{1}^{1}+\mathrm{x}_{1}^{2}+\ldots+\mathrm{x}_{1}^{7}\right)$ where $\mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}^{\mathrm{i}}+\mathrm{x}_{2}^{\mathrm{i}} \mathrm{g}_{1}+\mathrm{x}_{3}^{\mathrm{i}} \mathrm{g}_{2} ; 1 \leq \mathrm{i} \leq 7$. Does $f \in L\left(V, Q^{+} \cup\{0\}\right)$ ?
84. Let $S=\left\{\begin{array}{cc}{\left.\left[\begin{array}{cc}a_{1} & a_{2} \\ a_{3} & a_{4} \\ \vdots & \vdots \\ a_{11} & a_{12}\end{array}\right] \right\rvert\, a_{i} \in Z^{+}\left(g_{1}, g_{2}, \ldots, g_{6}\right), 1 \leq i \leq 12}\end{array}\right.$

$1 \leq j \leq 6\}$ be a strong special semibivector space of special dual like numbers over the semifield
$Z^{+}\left(g_{1}, g_{2}, \ldots, g_{6}\right) \cup\{0\}$.
(i) Find a basis of $S$ over $\mathrm{Z}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}, \ldots, \mathrm{~g}_{6}\right) \cup\{0\}$.
(ii) Find $\operatorname{Hom}(S, S)$. For at least one $T \in \operatorname{Hom}(S, S)$. find eigen values and eigen vectors associated with T.
(iii) Write S as a direct sum of special semivector subspaces of special dual like numbers.
(iv) Can S be made into a semilinear algebra by defining $\times_{\mathrm{n}}$, the natural product?
86. Let $\mathrm{S}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Z}_{7}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right)\right.$ where $\mathrm{g}_{1}, \mathrm{~g}_{2} \in \mathrm{~L}$

be a vector space special dual like numbers over the field $\mathrm{Z}_{7}$.
(i) Find dimension of V over $\mathrm{Z}_{7}$.
(ii) Can $V$ be written as a direct sum?
(iii) Find $\operatorname{Hom}(\mathrm{V}, \mathrm{V})$.
(iv) Study the structure of $\mathrm{L}\left(\mathrm{V}, \mathrm{Z}_{7}\right)$.
87. What happens if in problem (86) $\mathrm{Z}_{7}$ is replaced by the S ring, $\mathrm{Z}_{7}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right)$, that is V is a Smarandache vector space of special dual like numbers over the S -ring $\mathrm{Z}_{7}\left(\mathrm{~g}_{1}, \mathrm{~g}_{2}\right)$.
88. Let $P=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{i} \in Q\left(g_{1}, g_{2}, \ldots, g_{6}\right)\right.$ where $g_{j} \in L=$

$1 \leq j \leq 6\}$ be a special vector space of special dual like numbers over the field Q .
(i) Find a basis of P over Q .
(ii) What is the dimension of P over Q ?
(iii) Can P be a linear algebra?
89. Study P in problem 88 as a S-vector space of special dual like numbers over the S-ring $Q\left(g_{1}, g_{2}, \ldots, g_{6}\right)$.
90. Let $\mathrm{S}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in \mathrm{Q}^{+}\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right) \cup\{0\}, \mathrm{g}_{1}, \mathrm{~g}_{2}, \in \mathrm{~L}=\right.$

be a semivector space of special dual like numbers over the semifield $\mathrm{Q}^{+} \cup\{0\}$.
(i) Find a basis of V over S .
(ii) Write S as a direct sum of semivector subspaces.
(iii) If S is a linear algebra can S be written as a direct sum of semilinear algebras?
(iv) Study the algebraic structure enjoyed by Hom(S, S).
(v) $\quad$ Is $\left\langle\mathrm{Z}_{20} \cup \mathrm{I}\right\rangle$, a general neutrosophic ring of special dual like number?
(vi) Characteristize some of the special features of special dual like numbers.
93. $\mathrm{Can} \mathrm{Z}_{56}$ have idempotents so that $\mathrm{a}+\mathrm{bg}_{1}, \mathrm{~g}_{1} \in \mathrm{Z}_{56} \backslash\{0,1\}$ is an idempotent contributing to special dual like numbers?
94. Does $Z_{n}$ for any $n$ have a subset $S$ such that $S$ is an idempotent semigroup of $Z_{n}$ ?
95. Find all the idempotent in $\mathrm{Z}_{48}$.
96. Is $0,16,96,160$ and 225 alone are idempotents of $Z_{240}$ ? Does $\mathrm{S}=\{0,16,96,160,225\} \subseteq \mathrm{Z}_{240}$ form a semigroup?
97. Let $S=\left\{\left.\left[\begin{array}{lllll}a_{1} & a_{2} & a_{3} & a_{4} & a_{5} \\ a_{6} & a_{7} & a_{8} & a_{9} & a_{10}\end{array}\right] \right\rvert\, a_{i} \in P=\left\{x_{1}+x_{2} \operatorname{tg}_{1}+\right.\right.$
$\mathrm{x}_{3} \mathrm{~g}_{2} \mid \mathrm{x}_{\mathrm{j}} \in \mathrm{Q}, 1 \leq \mathrm{j} \leq 3, \mathrm{~g}_{1}=4$ and $\left.\mathrm{g}_{2}=9 \in \mathrm{Z}_{12}\right\}, 1 \leq \mathrm{i} \leq$ $10\}$ be a general vector space of special dual like numbers over the field Q .
(i) Find a basis of $S$ over $Q$ ?
(ii) What is the dimension of $S$ over Q ?
(iii) Find $\operatorname{Hom}(\mathrm{S}, \mathrm{S})$.
(iv) Find eigen values and eigen vectors for some $T \in$ $\operatorname{Hom}(S, S)$ such that $\mathrm{T}^{2}=(0)$.
(v) Write P as a direct sum of subspaces.
98. Let $M=\left\{\left.\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3} \\ a_{4}\end{array}\right] \right\rvert\, a_{i} \in\langle R \cup I\rangle, 1 \leq i \leq 4\right\}$ be a general
vector space of neutrosophic special dual like numbers over the field R .
(i) Find dimension of M over R .
(ii) Find a basis of $M$ over $R$.
(iii) Find the algebraic structure enjoyed by $\operatorname{Hom}(\mathrm{M}$, M).
(iv) If $T: M \rightarrow M$ be defined by $T\left[\begin{array}{l}a_{1} \\ a_{2} \\ a_{3} \\ a_{4}\end{array}\right]=\left[\begin{array}{c}a_{1} \\ 0 \\ a_{2} \\ 0\end{array}\right]$ find
eigen values and eigen vectors associated with T .
99. Let $\mathrm{S}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in\left\langle\mathrm{Z}_{11} \cup \mathrm{I}\right\rangle, \mathrm{I}^{2}=\mathrm{I}\right\}$ be the general ring of neutrosophic polynomial of special dual like numbers.
(i) Can S have zero divisors?
(ii) Can S have units?
(iii) Is S a Smarandache ring?
(iv) Can S have ideals?
(v) Can S have subrings which are not ideals?
(vi) Can S have idempotents?
100. Let $P=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{i} \in\left\langle Z_{12} \cup I\right\rangle, I^{2}=I\right\}$ be the general ring
of neutrosophic polynomial of special dual like numbers.
(i) Prove P has zero divisors?
(ii) Find ideals of P .
(iii) Find subrings in P which are not ideals of P .
(iv) Can P have idempotents?
(v) Prove $P$ is a S-ring.
(vi) Does $\mathrm{p}(\mathrm{x})=\mathrm{x}^{2}-(7+3 \mathrm{I}) \mathrm{x}+0(5+3 \mathrm{I})$ reducible in P ?
101. Let $S=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{i} \in\langle R \cup I\rangle ; I^{2}=I\right\}$ be the general ring
of neutrosophic polynomial of special dual like numbers.
(i) Does S contain polynomials which are irreducible in S ?
(ii) Find the roots of the polynomial $(3+4 I) x^{3}+(5-3 I) x^{2}$ $+7 \mathrm{Ix}-(8 \mathrm{I}-4)$.
(iii) Is $T=\left\{\sum_{i=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{i}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in\langle\mathrm{Z} \cup \mathrm{I}\rangle ; \mathrm{I}^{2}=\mathrm{I}\right\} \subseteq \mathrm{S}$ an ideal of S?
(iv) Can S have zero divisors?
102. Let $W=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{i} \in\langle Q \cup I\rangle ; I^{2}=I\right\}$ be the general
ring of neutrosophic polynomial of special dual like numbers over the field Q .
(i) Find subspaces of W.
(ii) Is W infinite dimensional?
(iii) Can linear functional from W to Q be defined?
(iv) Can eigen values of any linear operator on T be a neutrosophic special dual like numbers?
103. Let $\mathrm{S}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{10}\right) \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}\right.$ where $1 \leq \mathrm{i}$ $\leq 10, \mathrm{x}_{\mathrm{j}} \in\langle\mathrm{Q} \cup \mathrm{I}\rangle ; 1 \leq \mathrm{j} \leq 3 \mathrm{~g}_{1}=9$ and $\left.\mathrm{g}_{2}=4 \in \mathrm{Z}_{12}\right\}$ be the general neutrosophic ring of special dual like elements.
(i) Find ideals of S.
(ii) Prove S has zero divisors.
(iii) Prove S has idempotents.
(iv) Does S contain subrings which are not ideals?
104. Let $V=\left\{\left.\left[\begin{array}{lllll}a_{1} & a_{2} & a_{3} & a_{4} & a_{5} \\ a_{6} & a_{7} & a_{8} & a_{9} & a_{10} \\ a_{11} & a_{12} & a_{13} & a_{14} & a_{15}\end{array}\right] \right\rvert\, a_{i} \in\left\langle Q^{+} \cup I\right\rangle ; 1 \leq i \leq\right.$
$15\}$ be a general vector space of neutrosophic semivector space over the semiring $\mathrm{S}=\left\langle\mathrm{Z}^{+} \cup \mathrm{I} \cup\{0\}\right\rangle$.
(i) Find a basis of V over S .
(ii) What is a dimension of V over S ?
(iii) Find $\operatorname{Hom}(\mathrm{V}, \mathrm{V})=\{\mathrm{T}: \mathrm{V} \rightarrow \mathrm{V}$ all semilinear operators on V$\}$ and the algebraic structure enjoyed by it.
(iv) $\quad \operatorname{Can} \mathrm{f}: \mathrm{V} \rightarrow \mathrm{S}$ be defined? Find $\mathrm{L}(\mathrm{V}, \mathrm{S})$.
105. Let $W=\left\{\left.\left[\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ a_{4} & a_{5} & a_{6} \\ a_{7} & a_{8} & a_{9}\end{array}\right] \right\rvert\, a_{i} \in\left\langle Q^{+} \cup\{0\} \cup I\right\rangle ; 1 \leq i \leq 9\right\}$
be a general semivector space of neutrosophic special dual like numbers over the semifield $\mathrm{S}=\left\langle\mathrm{Z}^{+} \cup\{0\} \cup\{\mathrm{I}\}\right\rangle$.
(i) Find dimension of W over S .
(ii) Find the algebraic structure enjoyed by L(W,S).
(iii) Can W be written as a direct sum of semivector subspaces?
(iv) Is W a linear semialgebra on W by define usual $\times$ product of matrices?
106. Let $W=\left\{\left.\left[\begin{array}{ll}a_{1} & a_{2} \\ a_{3} & a_{4} \\ a_{5} & a_{6}\end{array}\right] \right\rvert\, a_{i}=x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+x_{5} g_{4}+\right.$
$\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}$ where $\mathrm{x}_{\mathrm{j}} \in \mathrm{Q}, 1 \leq \mathrm{j} \leq 7$ and

$1 \leq \mathrm{p} \leq 6\}$ be the general vector space of special dual like numbers over the field Q .
(i) Find dimension of S over Q .
(ii) Find $\operatorname{Hom}_{\mathrm{Q}}(\mathrm{S}, \mathrm{S})$.
(iii) Can a eigen value of $\mathrm{T}: \mathrm{S} \rightarrow \mathrm{S}$ be special dual like numbers?
107. Let $\mathrm{M}=\left\{\mathrm{x}_{0}+\mathrm{x}_{1} \mathrm{~g}_{1}+\mathrm{x}_{2} \mathrm{~g}_{2}+\mathrm{x}_{3} \mathrm{~g}_{3}+\mathrm{x}_{4} \mathrm{~g}_{4}+\mathrm{x}_{5} \mathrm{~g}_{5}+\mathrm{x}_{6} \mathrm{~g}_{6} \mid\right.$ $\mathrm{x}_{\mathrm{i}} \in \mathrm{Q} ; 0 \leq \mathrm{i} \leq 6$ and $\mathrm{g}_{1}=(\mathrm{I}, 0,0,0,0,0), \mathrm{g}_{2}=(0, \mathrm{I}, 0,0,0,0)$ $\mathrm{g}_{3}=(0,0, \mathrm{I}, 0,0,0), \mathrm{g}_{4}=(0,0,0, \mathrm{I}, 0,0) \mathrm{g}_{5}=(0,0,0,0, \mathrm{I}, 0)$ and $\mathrm{g}_{6}=(0,0,0,0,0, \mathrm{I})$ with $\left.\mathrm{I}^{2}=\mathrm{I}\right\}$ be a general linear algebra of neutrosophic special dual like numbers over the field Q .
(i) Find dimension of M over Q .
(ii) Find a basis of M over Q .
(iii) Write M as a pseudo direct sum of subspaces of M over Q.
(iv) Find $\operatorname{Hom}(\mathrm{M}, \mathrm{M})$.
(v) Find L(M, Q).
108. Find $\mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}_{13} ; 1 \leq \mathrm{i} \leq\right.$ $5, \mathrm{~g}_{1}=(\mathrm{I}, 0,0,0), \mathrm{g}_{2}=(0, \mathrm{I}, 0,0), \mathrm{g}_{3}=(0,0, \mathrm{I}, 0)$ and $\mathrm{g}_{4}=$ $(0,0,0, \mathrm{I})\}$ be a general vector space of neutrosophic special dual like numbers over the field $\mathrm{Z}_{13}$.
(i) Find the number of elements in P .
(ii) Find dimension of P over $\mathrm{Z}_{13}$.
(iii) Find a basis of P over $\mathrm{Z}_{13}$.
(iv) Can P have more than one basis over $\mathrm{Z}_{13}$ ?
(v) How many basis can P have over $\mathrm{Z}_{13}$ ?
109. Let $\mathrm{F}=\left\{\left\langle\mathrm{Z}_{37} \cup \mathrm{I}\right\rangle\right\}$ be the general neutrosophic ring of special dual like numbers.
(i) Find order of F.
(ii) Is F a S-ring?
(iii) Find ideals in F .
(iv) Can F have subrings which are not ideals?
(v) Can F have zero divisors?
(vi) Can F have idmepotents other than I?
110. Let $A=\left\{\left.\left[\begin{array}{llll}x_{1} & x_{2} & x_{3} & x_{4} \\ x_{5} & x_{6} & x_{7} & x_{8}\end{array}\right] \right\rvert\, x_{j}=a_{1}+a_{2} g_{1}+a_{3} g_{2}+x_{4} g_{3}\right.$ where $\mathrm{a}_{\mathrm{i}} \in \mathrm{Q}, 1 \leq \mathrm{i} \leq 4,1 \leq \mathrm{j} \leq 8, \mathrm{~g}_{1}=6, \mathrm{~g}_{2}=9$ and $\mathrm{g}_{3}=4$ $\left.\in Z_{12}\right\}$ be the general ring of mixed dual numbers.
(i) Can A have zero divisors?
(ii) Find idemponents in A?
(iii) Prove A is a commutative ring.
111. Let $A=\left\{\left.\left[\begin{array}{cccc}a_{1} & a_{2} & \ldots & a_{10} \\ a_{11} & a_{12} & \ldots & a_{20} \\ a_{21} & a_{22} & \ldots & a_{30}\end{array}\right] \right\rvert\, a_{i} \in\left\langle Z_{12} \cup I\right\rangle ; 1 \leq i \leq 30\right.$,
$\left.\mathrm{I}^{2}=\mathrm{I}\right\}$ be the general neutrosophic matrix ring of special dual like numbers.
(i) Find zero divisors of S .
(ii) Can S have subrings which are not ideals?
(iii) Find ideals of S.
(iv) Can S have idempotents?
(v) Does S contain Smarandache zero divisors?
112. Let $\mathrm{T}=\left\{\left.\left[\begin{array}{c}a_{1} \\ a_{2} \\ \vdots \\ a_{12}\end{array}\right] \right\rvert\, a_{i} \in\left\langle Z_{7} \cup \mathrm{I}\right\rangle ; 1 \leq i \leq 12\right\}$ be the general
neutrosophic ring of special dual like numbers.
(i) Find the numbers of elements in T .
(ii) Can T have idemponents?
(iii) Give some special features enjoyed by T.
(iv) Does T contain Smarandache ideals?
113. Let $A=\left\{\left.\left[\begin{array}{llll}a_{1} & a_{2} & \ldots & a_{15} \\ a_{16} & a_{17} & \ldots & a_{30}\end{array}\right] \right\rvert\, a_{i} \in(c, d] c, d \in\left\{x_{1}+\right.\right.$
$\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}+\mathrm{x}_{6} \mathrm{~g}_{5}+\mathrm{x}_{7} \mathrm{~g}_{6}+\mathrm{x}_{8} \mathrm{~g}_{7} \mid \mathrm{x}_{\mathrm{j}} \in[0,1]$, $1 \leq \mathrm{j} \leq 8, \mathrm{~g}_{1}=16, \mathrm{~g}_{2}=60, \mathrm{~g}_{3}=96, \mathrm{~g}_{4}=120, \mathrm{~g}_{5}=160, \mathrm{~g}_{6}=$ 180 and $\left.\left.\mathrm{g}_{7}=225 \in \mathrm{Z}_{240}\right\}, 1 \leq \mathrm{i} \leq 30\right\}$ be a closed open interval fuzzy semigroup of mixed dual numbers under min.
(i) Find zero divisors in M .
(ii) Can M have idempotents?
(iii) Can every elements in M be an idempotent?
(iv) Find ideals in M .
(v) Can M have subsemigroup which are not ideals?
114. Find some interesting properties associated with interval fuzzy semigroup of mixed dual numbers.
115. Obtain some applications of interval fuzzy semigroups of special dual like numbers under min (or max operation).
116. Let $\mathrm{P}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\ldots+\mathrm{x}_{18} \mathrm{~g}_{17} \mid \mathrm{x}_{\mathrm{j}} \in[0,1], 1 \leq \mathrm{j} \leq\right.$ $18, \mathrm{~g}_{\mathrm{p}} \in \mathrm{L}=$ chain lattice of order 19$\}$ be the general fuzzy semigroup of special dual like numbers under min operation.
(i) Find fuzzy subsemigroups of P which are not fuzzy ideals.
(ii) Find ideals in P .
(iii) Under min operation can P have zero divisors?
(iv) If max operation is performed on P can P have zero divisors?
117. Obtain any interesting property / application enjoyed by general fuzzy semigroup of special dual like numbers.
Let $\mathrm{M}=\left\{[\mathrm{a}, \mathrm{b}] \mid \mathrm{a}, \mathrm{b} \in \mathrm{S}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3}+\mathrm{x}_{5} \mathrm{~g}_{4}\right.\right.$ where $\mathrm{x}_{\mathrm{i}} \in \mathrm{Q}^{+} \cup\{0\}, 1 \leq \mathrm{i} \leq 5, \mathrm{~g}_{\mathrm{p}} \in \mathrm{L}, \mathrm{L}$ a chain lattice of order six, $1 \leq \mathrm{p} \leq 4\}$ be a general closed interval semivector space over the semifield $\mathrm{T}=\mathrm{Q}^{+} \cup\{0\}$.
(i) Find a basis of M over T .
(ii) Find $\operatorname{Hom}(\mathrm{M}, \mathrm{M})$.
(iii) Find $\mathrm{L}(\mathrm{M}, \mathrm{T})$.
118. Let $\mathrm{V}=\left\{\left(\mathrm{a}_{1}, \mathrm{a}_{2}\right] \mid \mathrm{a}_{\mathrm{i}}=\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\mathrm{x}_{3} \mathrm{~g}_{2}+\mathrm{x}_{4} \mathrm{~g}_{3} ; 1 \leq \mathrm{i} \leq 2, \mathrm{x}_{\mathrm{j}}\right.$ $\in \mathrm{Z}_{127}, 1 \leq \mathrm{j} \leq 4$,

be a general vector space over the field $\mathrm{Z}_{127}$ of special dual like numbers.
(i) Find a basis of V over over $\mathrm{Z}_{127}$.
(ii) Write V as a direct sum.
(iii) Find $\mathrm{T}: \mathrm{V} \rightarrow \mathrm{V}$ so that $\mathrm{T}^{-1}$ does not exist.
(iv) How many elements does V contain?
(v) Find $\mathrm{L}\left(\mathrm{V}, \mathrm{Z}_{127}\right)$.
119. Is every ideal in $\mathrm{P}=\left\{\sum_{\mathrm{i}=0}^{\infty} \mathrm{a}_{\mathrm{i}} \mathrm{x}^{\mathrm{i}} \mid \mathrm{a}_{\mathrm{i}} \in\left\langle\mathrm{Z}_{19} \cup \mathrm{I}\right\rangle\right\}$ principal? Justify.
120. Can $S=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \mid a_{1}=x_{i}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3}+x_{5} g_{4}+x_{6} g_{5}\right.$
with $\left.\mathrm{x}_{\mathrm{p}} \in \mathrm{R}, \mathrm{g}_{\mathrm{j}} \in \mathrm{L} ; 1 \leq \mathrm{j} \leq 5,1 \leq \mathrm{p} \leq 6\right\}$ have S-ideals?
121. Let $W=\left\{\left[\begin{array}{l}x_{1} \\ x_{2} \\ x_{3} \\ x_{4}\end{array}\right]+\left[\begin{array}{l}y_{1} \\ y_{2} \\ y_{3} \\ y_{4}\end{array}\right] I\left\{x_{i}, y_{j} \in Q ; 1 \leq i, j \leq 4\right\}\right.$ be the
neutrosophic general ring of special dual like numbers.
(i) Find ideals of W.
(ii) Does W contain S -subrings which are not ideals?
(iii) Can W have S-idempotents?
122. Let $\mathrm{P}=\left\{\begin{array}{llll}\mathrm{x}_{1} & x_{2} & \ldots & x_{5} \\ \mathrm{x}_{6} & x_{7} & \ldots & x_{10} \\ \mathrm{x}_{11} & x_{12} & \ldots & x_{15}\end{array}\right]+\left[\begin{array}{cccc}y_{1} & y_{2} & \ldots & y_{5} \\ y_{6} & y_{7} & \ldots & y_{10} \\ y_{11} & y_{12} & \ldots & y_{15}\end{array}\right]|I| x_{i}$,
$\left.y_{i} \in R ; 1 \leq i, j \leq 15\right\}$ be a general neutrosophic ring of special dual like numbers.
(i) Find ideals of P .
(ii) Does P have S zero divisors?
(iii) Prove P is isomorphc to

$$
S=\left(\begin{array}{cccc}
x_{1}+y_{1} I & x_{2}+y_{2} I & \ldots & x_{5}+y_{5} I \\
x_{6}+y_{6} I & x_{7}+y_{7} I & \ldots & x_{10}+y_{10} I \\
x_{11}+y_{11} I & x_{12}+y_{12} I & \ldots & x_{15}+y_{15} I
\end{array}\right) \text { where }
$$

$\left.x_{i}, y_{i} \in R, 1 \leq i \leq 15\right\}$ as a ring of special dual like numbers.
123. Let $R=\left\{\sum_{i=0}^{\infty} a_{i} x^{i} \left\lvert\, a_{i}=\left[\begin{array}{c}x_{1}+y_{1} I \\ \vdots \\ x_{9}+y_{9} I\end{array}\right]\right. ; x_{i}, y_{i} \in Q, 1 \leq i \leq 9\right\}$
be a general neutrosophic polynomial ring of special dual like numbers.
(i) Prove R has zero divisors.
(ii) Can R have S -zero divisors?
(iii) Is R a S-ring?
(iv) Can R have S -subrings which are not ideals?
124. Let $\mathrm{M}=\left\{\left(\left.\left[\begin{array}{cccc}a_{1} & a_{2} & \ldots & a_{7} \\ a_{8} & a_{9} & \ldots & a_{14} \\ a_{15} & a_{16} & \ldots & a_{21}\end{array}\right] \right\rvert\, a_{i} \in\langle Q \cup I\rangle 1 \leq i \leq 21\right\}\right.$
be a general vector space over Q of special neutrosophic dual like number over Q .
(i) Find a basis of M over Q .
(ii) Find subspaces of $M$ so that $M$ is a direct sum of subspaces.
(iii) Find $\operatorname{Hom}(\mathrm{M}, \mathrm{M})$.
(iv) Find L(M, Q).
(v) If Q is replaced $\langle\mathrm{Q} \cup \mathrm{I}\rangle, \mathrm{M}$ is a S -vector space find $\mathrm{L}(\mathrm{M},\langle\mathrm{Q} \cup \mathrm{I}\rangle)$.
(vi) Find S -basis of M over $\langle\mathrm{Q} \cup \mathrm{I}\rangle$.
125. Obtain some special properties enjoyed by general vector spaces of special dual like numbers of $n$-dimension $n>2$.
126. Obtain some special features enjoyed by general semilinear algebra of special dual like numbers of $t$ dimension, $\mathrm{t} \geq 3$.
127. Study problems (126) and (125) in case of mixed dual numbers of dimension $>2$.
128. Let $S=Z_{8}\left(g_{1}, g_{2}, g_{3}\right)=\left\{x_{1}+x_{2} g_{1}+x_{3} g_{2}+x_{4} g_{3} \mid x_{i} \in Z_{8}\right.$, $1 \leq \mathrm{i} \leq 8, \mathrm{~g}_{1}=6, \mathrm{~g}_{2}=4$ and $\left.\mathrm{g}_{3}=9 \in \mathrm{Z}_{12}\right\}$, study the algebraic structure enjoyed by S .
129. Find the mixed dual number semigroup component of $\mathrm{Z}_{112}$.
130. Study the mixed dual number semigroup component of $\mathrm{Z}_{352}$.
131. Study the semigroup mixed dual number component of $\mathrm{Z}_{23 \mathrm{p}}$, where p is a prime.
132. Study the semigroup mixed dual number of component of $\mathrm{Z}_{64 \mathrm{~m}}$ where m is a odd and not a prime.
133. Compare problems (131) and (132) (that is the nature of the mixed semigroups).
134. Study the general ring of mixed dual numbers of dimension 9 .
135. Can any other algebraic structure other than modulo integer $Z_{n}$ contribute to mixed dual numbers?
136. Show we can have any desired dimensional general ring of special dual like numbers (semiring or vector space or semivector space).
137. Obtain some special properties enjoyed by fuzzy semigroup of mixed dual numbers.
138. Let $\mathrm{M}=\left\{\mathrm{x}_{1}+\mathrm{x}_{2} \mathrm{~g}_{1}+\ldots+\mathrm{x}_{20} \mathrm{~g}_{19} \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{Z}^{+} \cup\{0\} ; 1 \leq \mathrm{i} \leq 20\right.$ and $\mathrm{g}_{\mathrm{j}} \in \mathrm{L}$ a chain lattice of order $\left.21,1 \leq \mathrm{j} \leq 19\right\}$ be a semivector space over the semifield $\mathrm{S}=\mathrm{Z}^{+} \cup\{0\}$ of special dual like numbers.
(i) Find a basis of M over S .
(ii) What is the dimension of M over S ?
(iii) Can M have more than one basis over S ?
(iv) Find $\operatorname{Hom}(\mathrm{M}, \mathrm{M})$.
(v) Find L(M, S).
139. Using the mixed dual number component semigroup of $\mathrm{Z}_{640}$ construct a general ring of mixed dual numbers with elements from $Z_{3}$. Study the properties of this ring.
140. Give an example of a Smarandache general ring of mixed dual numbers.
141. Study the properties of open-closed interval general ring of mixed dual numbers.
142. Characterize all $Z_{n}$ which has mixed dual numbers semigroup component.
143. Characterize those $Z_{n}$ which has idempotent semigroup.
144. Characterize those $Z_{n}$ which has no idempotent (when $n$ not a prime).
145. Characterize those $Z_{n}$ which has no mixed dual number semigroup component ( $n$ not a prime $n \neq 2^{t}$ ).

## About the Authors

Dr.W.B.Vasantha Kandasamy is an Associate Professor in the Department of Mathematics, Indian Institute of Technology Madras, Chennai. In the past decade she has guided 13 Ph.D. scholars in the different fields of non-associative algebras, algebraic coding theory, transportation theory, fuzzy groups, and applications of fuzzy theory of the problems faced in chemical industries and cement industries. She has to her credit 646 research papers. She has guided over 68 M.Sc. and M.Tech. projects. She has worked in collaboration projects with the Indian Space Research Organization and with the Tamil Nadu State AIDS Control Society. She is presently working on a research project funded by the Board of Research in Nuclear Sciences, Government of India. This is her $70^{\text {th }}$ book.

On India's 60th Independence Day, Dr.Vasantha was conferred the Kalpana Chawla Award for Courage and Daring Enterprise by the State Government of Tamil Nadu in recognition of her sustained fight for social justice in the Indian Institute of Technology (IIT) Madras and for her contribution to mathematics. The award, instituted in the memory of Indian-American astronaut Kalpana Chawla who died aboard Space Shuttle Columbia, carried a cash prize of five lakh rupees (the highest prize-money for any Indian award) and a gold medal.
She can be contacted at vasanthakandasamy@gmail.com

Dr. Florentin Smarandache is a Professor of Mathematics at the University of New Mexico in USA. He published over 75 books and 200 articles and notes in mathematics, physics, philosophy, psychology, rebus, literature. In mathematics his research is in number theory, non-Euclidean geometry, synthetic geometry, algebraic structures, statistics, neutrosophic logic and set (generalizations of fuzzy logic and set respectively), neutrosophic probability (generalization of classical and imprecise probability). Also, small contributions to nuclear and particle physics, information fusion, neutrosophy (a generalization of dialectics), law of sensations and stimuli, etc. He got the 2010 Telesio-Galilei Academy of Science Gold Medal, Adjunct Professor (equivalent to Doctor Honoris Causa) of Beijing Jiaotong University in 2011, and 2011 Romanian Academy Award for Technical Science (the highest in the country). Dr. W. B. Vasantha Kandasamy and Dr. Florentin Smarandache got the 2011 New Mexico Book Award for Algebraic Structures. He can be contacted at smarand@unm.edu

In this book we define $x=a+b g$; to be a special dual like number $\Rightarrow$ where $a, b$ are reals and $g$ is a new element such that $\mathrm{g}^{2}=\mathrm{g}$. The new 1 element which is an idempotent can be got from $Z_{n}$ or from lattices or A ): from linear operators. Mixed dual numbers are constructed using $\sqrt{\top}$ dual numbers and special dual like numbers. Neutrosophic numbers are a natural source of special dual like numbers.
