Abstract

As an epitaph of the project for so-called GW astronomy, I suggest the famous saying by Confucius: “The hardest thing of all is to find a black cat in a dark room, especially if there is no cat”. Specific examples are drawn from GW150914 and LISA Pathfinder, to explain why GW astronomy was born dead from the outset. Since the issue of energy transport by gravity is crucial to General Relativity, in the second part of the paper I offer a hypothesis about the origin of gravitational radiation in Relative Scale (RS) spacetime, and outline hypothetical applications of spacetime engineering for producing ecologically clean and unlimited energy by polarization of the so-called light vacuum.

Comment: Due to the sensitive nature of clean unlimited energy sources from spin-0 gravitational radiation, the full paper is available only upon request (Matthew 7:6).

1. Is GW astronomy fake but too big to fail?

I smell a rat. You cannot observe something that cannot exist. For example, pink unicorns dancing with red herrings, or back holes emitting “gravitons” by linearized gravitational waves (GWs), as in the case of GW astronomy. It makes no sense whatsoever. Let me explain the situation, ensuing from the principle of Sherlock Holmes: When you have eliminated the impossible, whatever remains, however improbable, must be the truth.

The announcement of “the first direct detection of gravitational waves” on 11 February 2016\textsuperscript{1,2}, denoted as GW150914, is a shocking provocation to General Relativity (GR): we are
fully aware of the inherent limitations of the linearized approximation of GR and know very well the requirements for detecting the “ripples” of spacetime metric. This provocation is sharply exacerbated from the parallel claim of “the first observation of a binary black hole merger”, given the well-known fact that we still do not understand the hypothetical formation of “event horizon”, and its interior spacetime, if any. Moreover, the proponents of GW astronomy “swept the garbage under the rug” by tacitly ignoring their unresolvable problems known at least since August 2002. All this leads to the suspicion that the whole GW “discovery” could be a fraud.

In the first part below, I will briefly explain two crucial errors of GW astronomy, based on a widely spread misconception (NB): bare spacetime (NB1) and GW parapsychology (NB2). In Part 2, I will examine the possibility that the signal, detected on September 14, 2015 at 09:50:45 UTC, was nevertheless a genuine GW signal confirmed later (September 2016) by LISA Pathfinder, and will offer (i) an explanation of GW localization without any spin-2 “gravitons”, and (ii) hypothetical applications of spacetime engineering for producing ecologically clean and unlimited gravitational radiation by polarization of the so-called light vacuum. Needless to say, Sherlock Holmes’ principle will be implemented as well.

First, let me focus on the crucial proposal by Rainer Weiss from 1972, suggesting “phase measurements in a Michelson interferometer” for detecting alteration of distances due to trespassing GW. Such transient changes of the interference pattern are the essence of all ground-based (LIGO, VIRGO and the like) and space-based (LISA Pathfinder) GW detectors.

In my opinion, Rainer Weiss made a grave error by breaking the fundamental rule of GR: there is no “bare” spacetime without matter. It is against the rules of GR to hypothesize that one could somehow suck out all matter from a spacetime region and end up with “bare” spacetime without any matter whatsoever, like the grin of the Cheshire cat without the cat. Yet this is exactly what all GW astronomers are trying to “measure”: a bare spacetime region defined only with its wiggling ‘size’ due to trespassing GWs coming from “binary black hole merger”, all of which can be detected with laser interferometers!

Surely Reiner Weiss, Kip Thorne, and all their colleagues knew very well that they are breaking the rules of GR. My explanation of their error is that they deliberately did it. But why? Perhaps because they cannot define the transport of energy by GWs and compute the stresses in the material substrate, produced by trespassing GWs. So they decided to “bypass” this fundamental requirement, as there can be no stresses induced on a light beam. Just “bare” distances coupled to “spin-two” GWs. Is the Brooklyn Bridge for sale?

NB1: If the proponents of GW astronomy wish to use GR, their first off task is to explain the coupling of GW strain, leading to stresses induced in some solid object — not light beam. Say, a plastic bottle.

Consider an empty plastic bottle on your desk, trespassed by GWs from PSR J1603-7202, with dimensionless amplitude 2.3x10^26, and explain the coupling of their wave strain to the plastic material of the bottle, leading to stresses. How can gravitational radiation produce work to induce stresses and squeeze the bottle? Perhaps at 2.3x10^26 m?

* The latest version of the paper, with live links, can be downloaded from http://chakalov.net.
“Only entities that have energy can possibly be perceived or measured, since exchange of energy between an object and the sensors is crucial for its detection.”
(Patrick Das Gupta, General Relativity for Pedestrians, arXiv:1604.00951v1, Sec. VI)

How are the static “curvature” and dynamic “ripples” of spacetime metric coupled to matter (Fig. 1), in order to deliver there the quasi-local gravitational energy? The same question applies to MIGA, since they expect that “differential phase fluctuations may arise from strain variations of the space-time metric induced by GWs” (Benjamin Canuel et al., arXiv:1604.02072v1).

**NB:** You may *not* couple the spacetime metric *directly* to phase differences, as Rainer Weiss proposed in 1972. Differential geometry *cannot* act on matter. Never did and never will. The *intangible* (Sir Hermann Bondi) gravitational energy is *not* present in the left-hand side of Einstein’s field equations. Current GR textbooks do not explain the coupling of such intangible form of energy to the tangible forms of energy and stresses in the right-hand side of Einstein’s field equations, so that gravity can produce work and stresses and squeeze the bottle (Fig. 1), with inevitable energy non-conservation (Hans Ohanian). Differential geometry alone *cannot* produce work. We don’t accept GW parapsychology.

The staggering confusion among GW “experts” is best illustrated by Patrick Das Gupta, who responded to my objections (Fig. 1) by email (9 April 2016) in the following way:

> Change in the distance due to GWs between atoms in the bottle
> will cause stresses as atoms have electromagnetic interaction
> between them. ----- Patrick

The initial cause implied in the text in the first line above is a plain ghost acting by sheer differential geometry. It cannot be traced back from the electromagnetic interactions between the atoms in the plastic bottle (Fig. 1), assuming some “short circuit” between the gravitational stress-energy tensor (Erik Curiel) and the electromagnetic tensor. The alleged gravitoelectromagnetism is a highly controversial approximation suggested only in a particular limiting case (Wikipedia) of dead flat spacetime. Gunnar Nordström tried to couple gravity to electromagnetic field in 1914, and of course failed. Joseph Weber never detected “ringing” of his aluminum bar. There is no “general field” to present the coupling of gravity to matter. Forget it. The linearized approximation of GR will kill the GW effect from the outset. We need an entirely different coupling of gravity to matter: the GW detector must be endowed with self-action, resembling the human brain (see Part 2). There ain’t no mathematical ghosts. Only matter coupled to itself and acting on itself by its own potential gravitational states of potential gravitational stress-energy. No tensors.
Moreover, the alleged GW astronomy \(^1\) requires a second “miracle” related to the bare spacetime (the grin of the Cheshire cat without the cat): no gamma-ray busts (GRBs) were detected on September 14, 2015 at 09:50:45 UTC. We were told (based on approximations in numerical relativity) that about 1.3 billion years ago, three solar masses were converted to bare (see NB2 below) gravitational radiation, and \(-5.4 \times 10^{47} \text{ J}\) of bare (see NB2 below) gravitational energy was released within a fraction of a second, but without “hot gas or stars swirl around them at far greater distances.”\(^{12}\) It is indeed a “miracle”: an enormous explosion due to black hole merger\(^6,7,8\) that emits GW signal without any GRBs.

According to Bruce Allen\(^12\), “For a tenth of a second [the collision] shines brighter than all of the stars in all the galaxies. But only (emphasis mine - D.C.) in gravitational waves.” Kip Thorne says that “other stellar explosions called gamma-ray bursts can also briefly outshine the stars, but the explosive black-hole merger sets a mind-bending record. (…) It is by far the most powerful explosion (emphasis mine - D.C.) humans have ever detected except for the big bang.”\(^{12}\)

How come this “mind-bending record” of “the most powerful explosion” (Kip Thorne\(^12\)) \(-5.4 \times 10^{47} \text{ J}\) released within 0.2s \(^2\) – was not detected as GRBs as well? For comparison, recall galaxy cluster MS 0735.6+7421: its GRBs were duly detected, but there was no “GW signal”, while “the most powerful explosion” (Kip Thorne\(^12\)) produced only a sneaky “GW signal”\(^1\) and no GRBs whatsoever.

How can we safely separate (i) immensely violent explosions producing only GRBs but no “GW signal” from (ii) immensely violent explosions producing only one “GW signal” but no GRBs, as claimed by Bruce Allen and Kip Thorne\(^12\)? Apparently by black holes\(^6,7,8\), provided that they are carefully interpreted with selected approximations from numerical relativity. Is the Brooklyn Bridge for sale, again?

**NB2:** If the proponents of GW astronomy\(^1\) wish to use GR, they must never use bare gravitational energy of some bare spacetime, resembling the grin of the Cheshire cat without the cat: GR does not admit such Biblical “miracles”. The object known in GR as ‘gravitational energy’ is like an adjective, say, ‘blue’. If they claim to have detected ‘blue’, they must explain what was ‘blue’, like in the example in Fig. 1 above. In GR the grin of the Cheshire cat is always on its face (Fig. 1), that is, in the right-hand side of Einstein’s field equations. It contains real physical stuff, not some mythical “gravitons”.

Only in parapsychology people talk about “mental energy”, simply because they cannot answer the question “energy of what?”, so they called it “mental”. GR is not compatible with such GW parapsychology. We do not accept Biblical “miracles” either. No way.

To sum up, I conclude that GW150914\(^1\) was most likely a plain fraud: see Sherlock Holmes’ principle above. There is no bare spacetime (NB1) nor bare gravitational energy (NB2) in General Relativity. If the proponents of GW astronomy\(^1\) wish to use gravitons, their first off task is to prove beyond any doubt that some (still unknown) renormalizable (Sic!) graviton with upper mass limit at \(2.16 \times 10^{-58} \text{ kg}\) and Compton wavelength “roughly 1 light-year” – not over \(10^{90} \text{ km}\) – does exist. And if they wish to talk about black holes, they also have to reformulate the so-called singularity theorems\(^17\) to include some “dark” scalar field that is perfectly smooth and violates the strong energy condition (SEC). First things first. Without such rigorous validation, their announcement of “the first direct detection of gravitational waves and the first observation of a binary black hole merger”\(^1\) is sheer jabberwocky.
But if LISA Pathfinder detects GW signal by September 2016, it will require an explanation. It will be an incredibly interesting observation, resembling Fred Hoyle’s discovery of a resonance in the carbon-12 nucleus — we cannot use the so-called anthropic principle, for the same reason we reject GW parapsychology. They do not make sense, to say the least. Therefore, we most likely will need new physics, which I will outline in Part 2 and Part 3 below.

2. How to detect and utilize physicalized gravitational energy?

Suppose, for the sake of the argument, that the signal detected last year had gravitational origin. To explain how this event might have happened, I will use an old joke.

Three men in a mental clinic, Tom, Dick, and Harry, have to pass a test before they check out. The test is very simple: how much is 2 + 2. The doctor asks Tom, and he replies: ‘11’. ‘Are you sure?’, asks the doc. ‘Of course’, says Tom, ‘2 + 2 makes 11. What else?’ ‘Well, you’ll have to stay here for another month or two, but you’ll be fine’. Same question to Dick. He immediately replies: ‘Tuesday’. ‘Are you sure?’ ‘But of course’, says Dick, ‘2 + 2 makes Tuesday. What else?’ ‘Well, you will have to stay here for another month or two’, says the doc. Finally comes Harry. Same question, and he immediately strikes back with 4. ‘Congratulations’, says the doc, ‘you passed the test and may check out tomorrow. But how did you actually calculate it?’ ‘Easy’, Harry replies, ‘I divided Tuesday by 11 and got 4. What else?’

The answer is obviously correct, but Harry’s calculation is like the so-called “graviton” that cannot, not even in principle, solve the cosmological constant problem: “the worst theoretical prediction in the history of physics!” This is the proof of the pudding of the mythical “graviton”, if any. The proponents of GW parapsychology (see NB2 above) never acknowledged this fact about their ‘pudding’, although they know perfectly well that any hypothetical “graviton” must explain the contribution of the quantum vacuum to gravity. This is conditio sine qua non for the alleged “fundamental cosmological scalar fields” and Higgs boson as well: Why is the universe larger than a football?

Now, can we explain the origin of the ‘correct answer’ without dividing Tuesday by 11? Perhaps we can, but we won’t be able to trace back any local astrophysical source: metaphorically speaking, the origin of GWs could be a global holistic “school of fish” created by non-linear interactions between every local fish and the entire ‘school of fish’.

What if the correction to the mass, energy-momentum, and angular momentum of every ‘fish’ (Fig. 1) is delivered by the entire ‘school of fish’ in terms of gravitational radiation? Such corrections and contributions to the transient state of every quasi-local fish, due to non-linear interactions between every fish and the holistic ‘school of fish’ it is “part” of (similar to particle’s self-energy), could be miniscule (Fig. 1). There will be no need for some “powerful explosion” somewhere in the cosmos. No need for dedicated “gravitons” to carry such corrections either, as non-linear GWs “transport” their source spread over the entire ‘school of fish’. In this sense, the gravitational energy is non-localizable.

Perhaps we encounter non-localizable gravitational energy density of the holistic ‘school of fish’ (placed in what is currently the left-hand side of Einstein’s field equations), which becomes physicalized upon its point-wise (Sic!) localization, by providing perpetual corrections to the mass, energy-momentum, and angular momentum of every quasi-local fish (Fig. 1) placed in what is currently the right-hand side of Einstein’s field equations. Locally, the gravitational energy is never “conserved”, as it comes from, and goes back to
the non-localizable\textsuperscript{15} holistic ‘school of fish’\textsuperscript{9}: the entire spacetime \textit{en bloc}. But again, this hypothesis will be put forward iff LISA Pathfinder detects genuine GW signal by September 2016. Once we have such indisputable fact, I will be happy to launch my explanation\textsuperscript{9,16}, after which I will suggest possible ways to harness such \textit{physicalized} spin-0 gravitational radiation by spacetime engineering. (Please read the comment above.)

3. Summary and conclusion

If the “GW astronomers” (see above) wish to refrain from speculating how pink unicorns would dance with red herrings (Sec. 1), they have to define the objects of their endeavors.

The first step is to reconcile the conundrum of “singularity”\textsuperscript{6,7,8,17} with perpetual energy \textit{non-conservation} (Paul Steinhardt) due to perpetual influx of positive energy densities (Sean Carroll) from some “dark” you-name-it\textsuperscript{13}. The prerequisite to this first step is to define the \textit{unique} reference frame at which all astronomical objects are “stationary” while at the same time the space itself is being “stretched out”, to explain the Hubble flow and ‘time from the \textit{scale factor}’, as read with a clock (see Fig. 13 in ‘The Spacetime’\textsuperscript{9}). Tough challenge, because in this \textit{unique} reference frame “one has canonical clocks (e.g. the temperature of the cosmic background radiation) that not only break Lorentz invariance defining a cosmic (global) time but break the Galilei invariance defining observers which are \textbf{at rest} (Sic! - D.C.) with respect to the cosmic background radiation” (Luca Lusanna \textit{et al.}). Yet only in this \textit{unique} reference frame the “GW astronomers” (see above) could define the perpetual energy \textit{non-conservation} (Paul Steinhardt), in order to eventually explain the “accelerated expansion” (see the drawing below) of the universe and speculate about some “signal”\textsuperscript{1} from \textit{genuine}\textsuperscript{4} — not \textit{fake} — GWs.
First things first. Then the “GW astronomers” can proceed further by reformulating the current geodesic equation ($\nabla_\mu T^{\mu\nu} \neq 0$ at all geodesic points), in order to explain the “localization” of gravitational energy and the singularity “theorems”, or whatever is left from them, and finally announce their double discovery: “the first direct detection of gravitational waves and the first observation of a binary black hole merger.”

![Fig. 3, adapted from D. Castelvecchi and A. Witze](image)

In summary, if the “GW astronomers” wish to use Einstein’s General Relativity, they must follow its rules:

1. Do not use the linearized approximation: check out Hermann Weyl.

2. Do not use “bare” distances (NB1) nor “bare” gravitational energy (NB2): there are no “spin-2 gravitons” in GR.

2.1. If they wish to use “gravitons”, they must reformulate the geodesic equation:

Using local coordinates on $M$, we can write the geodesic equation (using the summation convention) as

$$\frac{d^2 \gamma^\lambda}{dt^2} + \Gamma^\lambda_{\mu\nu} \frac{d\gamma^\mu}{dt} \frac{d\gamma^\nu}{dt} = 0,$$

where $\gamma^\mu = x^\mu \circ \gamma(t)$ are the coordinates of the curve $\gamma(t)$ and $\Gamma^\lambda_{\mu\nu}$ are the Christoffel symbols of the connection $\nabla$.

Notice the dubious non-tensorial, second-kind Christoffel symbols in the excerpt above.

3. Do not ignore the unsolved problems of “GW astronomy”, which were acknowledged in August 2002. It is a widely known fact that the gravitational energy cannot be conserved
(Carl Hoefer). As Sean Carroll acknowledged, “in general relativity spacetime can give energy to matter, or absorb it from matter, so that the total energy simply isn’t conserved.” Therefore, the assumption that 3 solar masses were “carried away” by GWs, in order to fulfill the “conservation” of total energy (after Hulse and Taylor), is false.

Check out the explanation on p. 19 in ‘The Spacetime’, depicted in Fig. 4 with four consecutive and brand new, re-created states of the Universe: if you believe that state 4 has been obtained from state 1 by unitaty “evolution”, you have insoluble problems.

Once the proponents of “GW astronomy” complete tasks 1-3 above, they will be ready to announce any discovery and claim that it is related to Einstein’s General Relativity.

But how they can connect the dots, I wonder.

Well, perhaps these 1000+ “GW astronomers” believe they are already too big to fail, given their impressive list of supporters:

“The authors gratefully acknowledge the support of the United States National Science Foundation (NSF) for the construction and operation of the LIGO Laboratory and Advanced LIGO as well as the Science and Technology Facilities Council (STFC) of the United Kingdom, the Max-Planck Society (MPS), and the State of Niedersachsen, Germany, for support of the construction of Advanced LIGO and construction and operation of the GEO 600 detector. Additional support for Advanced LIGO was provided by the Australian Research Council. The authors gratefully acknowledge the Italian Istituto Nazionale di Fisica Nucleare (INFN), the French Centre National de la Recherche Scientifique (CNRS), and the Foundation for Fundamental Research on Matter supported by the Netherlands Organisation for Scientific Research, for the construction and operation of the Virgo detector, and for the creation and support of the EGO consortium. The authors also gratefully acknowledge research support from these agencies as well as by the Council of Scientific and Industrial Research of India, Department of Science and Technology, India, Science & Engineering Research Board (SERB), India, Ministry of Human Resource Development, India, the Spanish Ministerio de Economía y Competitividad, the Conselleria d’Economia i Competitivitat and Conselleria d’Educació, Cultura i Universitats of the Govern de les Illes Balears, the National Science Centre of Poland, the European Commission (Sic! – D.C.), the Royal Society, the Scottish Funding Council, the Scottish Universities Physics Alliance, the Hungarian Scientific Research Fund (OTKA), the Lyon Institute of Origins (LIO), the National Research Foundation of Korea, Industry Canada and the Province of Ontario through the Ministry of Economic Development and Innovation, the Natural Sciences and Engineering Research Council of Canada, Canadian Institute for Advanced Research, the Brazilian Ministry of Science, Technology, and Innovation, Russian Foundation for Basic Research, the Leverhulme Trust, the Research Corporation, Ministry of Science and Technology (MOST), Taiwan, and the Kavli Foundation. The authors gratefully acknowledge the support of the NSF, STFC, MPS, INFN, CNRS and the State of Niedersachsen, Germany, for provision of computational resources.”
Which means that these “GW astronomers” (see above) don’t have to do anything. They already managed to fool their supporters (including the European Commission), and even a highly prestigious scientific journal. They got the money they need — taxpayers’ money — and now they can play Sergeant Schultz: “I hear nothing, I see nothing, I know nothing!”

What will you do, my dear reader? Keep silent? Or praise Emperor’s new clothes, because he may be too big to fail?

D.C., April 11, 2016

16. Regarding the proposal for polarization of the so-called light vacuum⁹, notice that many outstanding puzzles in theoretical physics, such as proton’s mass, the anthropic principle, and the non-zero value of the cosmological “constant”, share an astonishing precision (Sic!) by which “positive” and “negative” constituents of the non-localizable quantum-gravitational ‘school of fish’¹⁴ are being cancelled — not just once, but at every instant ‘here and now’⁹, leading to perfectly correlated and bootstrapped evolving Universe (resembling human development). In the case of proton’s mass, the error margin for this cancellation is one part in 10⁴⁵, and for the fine-tuned Universe and the cosmological “constant” the precision of this cancellation is much higher (forget about “multiverses”). In my opinion, this is a complex phenomenon, which requires a brand new approach to quantum gravity⁹. To avoid ‘dividing Tuesday by 11’, I strictly follow Sherlock Holmes’ principle above, and will suggest the only possible (to the best of my knowledge⁹) solution. It is indirectly falsifiable, in the sense that any other solution must necessarily be wrong. The full paper is available upon request (Matthew 7:6).

Annals of Physics, 48, 526-540 (1968), p. 527: “We shall not be concerned here with so-called “coordinate singularities”. This term refers to a spacetime which has been expressed in an improper coordinate system. Thus, for example: 1. The Schwarzschild (Hilbert-Droste-Weyl - D.C.) solution has a coordinate singularity at $r = 2m$ because Schwarzschild originally chose coordinates for his solution which are not applicable on this surface. (...) The presence or absence of a coordinate singularity is not a property of the spacetime itself, but rather of the physicist who has chosen the coordinates by which the spacetime is described.”

19. According to R. Penrose (The Road to Reality, Jonathan Cape, London, 2004, p. 777), “any non-constancy in [lambda] would have to be accompanied by a compensating non-conservation of the mass-energy of the matter.” Two things. First, [lambda] is not a constant, but an evolving parameter of the evolving Universe, resembling the human development: see p. 18 in ‘The Spacetime’. And secondly, there is no need for any compensation of the evolving [lambda] by “non-conservation of the mass-energy of the matter.” People like Roger Penrose and Mu-Tao Wang (Jan 8, 2015) may argue about “conservation” viz. “non-conservation” iff they could define ‘gravitationally isolated system’ by reaching “the limit when the system becomes completely spatially isolated from everything else” (R. Penrose, op. cit., Fig. 19.10, pp. 467-468) in the first place. Forget it. The proposal in Sec. 4 and Sec. 8 in ‘The Spacetime’ solves both the old cosmological “constant” problem and the coincidence problem. More at Fig. 1.

20. The ontology of the gravitational “field” (see above) is known since 1935, thanks to Erwin Schrödinger: “In general, a variable has no definite value before I measure it; then measuring it does not mean ascertaining the value that it has.” (Erwin Schrödinger, Die gegenwärtige Situation in der Quantenmechanik, Naturwissenschaften 23, S. 807-812; 823-828; 844-849 (1935). Translated by John D. Trimmer, available at this http URL.) Detailed explanation of potential gravitational reality is available in Sec. 4 in ‘The Spacetime’. Read also Albert Einstein from November 1918 (ref. [18] therein, p. 29) and recall his famous statement about GR:

The right side is a formal condensation of all things whose comprehension in the sense of a field-theory is still problematic. Not for a moment, of course, did I doubt that this formulation was merely a makeshift in order to give the general principle of relativity a preliminary closed expression. For it was essentially not anything more than a theory of the gravitational field, which was somewhat artificially isolated from a total field of as yet unknown structure.
