An analysis of four Smarandache concatenated sequences using the notion of cm-integers

Marius Coman

Abstract. In this paper I show that Smarandache concatenated sequences presented here (i.e. The consecutive numbers sequence, The concatenated odd sequence, The concatenated even sequence, The concatenated prime sequence), sequences well known for the common feature that contain very few terms which are primes, per contra, contain very many terms which are c-primes, m-primes, c-reached primes and m-reached primes (notions presented in my previous papers, see “Conjecture that states that any Carmichael number is cm-composite” and “A property of repdigit numbers and the notion of cm-integer”).

Note:

The Smarandache concatenated sequences are well known for sharing a common feature: they all contain a small number of prime terms. Interesting is that, per contra, they seem to contain a large number of c-primes and m-primes. More than that, applying different operations on terms, like the sum of two consecutive terms or partial sums, we obtain again a large number of c-primes and m-primes respectively of c-reached primes and m-reached primes.

Note:

In the following analysis I will not show how I calculated the c-reached primes and the m-reached primes, see for that my paper “The notions of c-reached prime and m-reached prime”.

Verifying the observation for the following Smarandache concatenated sequences:

(1) The Smarandache consecutive numbers sequence

\( S_n \) is defined as the sequence obtained through the concatenation of the first \( n \) positive integers. The first ten terms of the sequence (A007908 in OEIS) are 12, 123, 1234, 12345, 123456, 1234567, 12345678, 123456789, 12345678910.
This sequence seems to have the property that the value of the sum of two consecutive terms is often (I conjecture that always) a cm-integer.

The first few such values are:

: \[12 + 123 = 135 = 3^3 \times 5.\] This number is cm-composite, having three c-reached primes, 7, 23, 43, and three m-reached primes, 23, 31, 47;
: \[123 + 1234 = 1357 = 23 \times 59.\] This number is cm-prime, having the c-reached prime equal to 37 and the m-reached prime equal to 1;
: \[1234 + 12345 = 13579 = 37 \times 367.\] This number is cm-prime, having the c-reached prime equal to 37 and the m-reached prime equal to 43;
: \[12345 + 123456 = 135801 = 3^2 \times 29 \times 91.\] This number is cm-composite, having a c-reached prime, 521, and a m-reached prime, 601;
: \[123456 + 1234567 = 1358023 = 67 \times 20269.\] This number is cm-prime, having the c-reached prime equal to 139;
: \[1234567 + 12345678 = 13580245 = 5 \times 7 \times 587 \times 661.\] This number is cm-composite, having three c-reached primes, 1693, 22549 and 387973, and two m-reached primes, 7561 and 1940041.

(2) The Smarandache concatenated odd sequence

\[S_n\] is defined as the sequence obtained through the concatenation of the first \(n\) odd numbers (the \(n\)-th term of the sequence is formed through the concatenation of the odd numbers from 1 to \(2n - 1\)). The first ten terms of the sequence (A019519 in OEIS) are 1, 13, 135, 1357, 13579, 1357911, 13579113, 1357911315, 135791131517, 13579113151719.

This sequence seems to have the property that the value of the terms is often (I conjecture that always) a cm-integer.

The first few such values are:

: 13. This number is prime, so cm-prime by definition;
: \[135 = 3^3 \times 5.\] This number is cm-composite, having four c-reached primes, 5, 7, 23 and 43, and three m-reached primes, 23, 31 and 47;
: \[1357 = 23 \times 59.\] This number is c-prime, having the c-reached prime equal to 47;
: \[13579 = 37 \times 367.\] This number is cm-prime, having the c-reached prime equal to 331 and the m-reached prime equal to 403;
: \[1357911 = 3^3 \times 19 \times 2647.\] This number is cm-composite, having a c-reached prime equal to 23767 and two m-reached primes equal to 8111 and 23879;

: \[13579113 = 11617 \times 11689.\] This number is c-prime, having the c-reached prime equal to 73.

(3) The Smarandache concatenated even sequence

\[S_n\] is defined as the sequence obtained through the concatenation of the first \(n\) even numbers (the \(n\)-th term of the sequence is formed through the concatenation of the even numbers from 1 to \(2^n\)). The first ten terms of the sequence (A019520 in OEIS) are 2, 24, 246, 2468, 246810, 24681012, 2468101214, 246810121416, 24681012141618, 2468101214161820.

This sequence seems to have the property that the value of the numbers \((S - 1)\), where \(S\) are the partial sums, is often (I conjecture that always) a cm-integer.

The first few such values are:

: \[2 + 24 - 1 = 25 = 5 \times 5.\] This number is cm-prime, having the c-reached prime equal to 1 and the m-reached prime equal to 5;

: \[2 + 24 + 246 - 1 = 271.\] This number is prime, so cm-prime by definition;

: \[2 + 24 + 246 + 2468 - 1 = 2739 = 3 \times 11 \times 83.\] This number is c-composite, having two c-reached primes equal to 239 and 911;

: \[2 + 24 + 246 + 2468 + 246810 - 1 = 249549 = 3 \times 193 \times 431.\] This number is cm-composite, having a c-reached prime equal to 149 and a m-reache primes equal to 8111 and 1009;

: \[2 + 24 + 246 + 2468 + 246810 + 24681012 - 1 = 24930561 = 3 \times 1187 \times 7001.\] This number is m-reached composite, having a m-reached prime equal to 22189.

This sequence seems also to have the property that the value of the numbers \((S - 1)\), where \(S\) is the sum of two consecutive terms, is often a cm-integer.

The first few such values are:

: \[2 + 24 - 1 = 25 = 5 \times 5.\] This number is cm-prime, having the c-reached prime equal to 1 and the m-reached prime equal to 5;

: \[24 + 246 - 1 = 269.\] This number is prime, so cm-prime by definition;

: \[246 + 2468 - 1 = 2713.\] This number is prime, so cm-prime by definition;
2468 + 246810 - 1 = 249277 = 7*149*249. This number is m-composite, having a reached m-prime equal to 35617.

(4) The concatenated prime sequence

$S_n$ is defined as the sequence obtained through the concatenation of the first $n$ primes. The first ten terms of the sequence (A019518 in OEIS) are 2, 23, 235, 2357, 235711, 23571113, 2357111317, 235711131719, 23571113171923, 2357111317192329.

This sequence seems to have the property that the value of the numbers $a(n) - a(n-1) - 1$ is often a cm-integer.

The first few such values are:

$235 - 23 - 1 = 211$. This number is prime, so cm-prime by definition;
$2357 - 235 - 1 = 2121 = 3*7*101$. This number is m-composite, having two m-reached primes, 107 and 709.
$235711 - 2357 - 1 = 233353$. This number is prime, so cm-prime by definition;
$23571113 - 235711 - 1 = 23335401$. I haven’t completely analyzed the number, but is at least m-composite having a m-reached prime 804697;
$2357111317 - 23571113 - 1 = 2333540203 = 541*4313383$. This number is c-prime (because $4313383 - 541 + 1 = 4312843 = 389*11087$ and $11087 - 389 + 1 = 10699 = 13*823$ and $823 - 13 + 1 = 811$, which is prime) having the c-reached prime equal to 811;
$235711131719 - 2357111317 = 233354020401 = 3^2*25928224489$. This number is m-composite (because $3*25928224489 + 3 - 1 = 77784673469$) having the m-reached prime equal to 77784673469.
